1 PRODUCT OVERVIEW

GENERAL DESCRIPTION

The SN8A1600 series is an 8-bit micro-controller utilized CMOS technology and featured with low power consumption and high performance by its unique electronic structure.

SN8A1602A is designed with the excellent IC structure including the program memory up to 1K-word MASK ROM, data memory of 48-bytes RAM, one 8-bit timer (TC0), a watchdog timer, two interrupt sources (TC0, INT0), and 4-level stack buffers.

More expansion functions come with SN8A1604A, such like 4K-work MASK ROM, more data memory of 128-byte RAM, 8-bit timer named TC1, and buzzer function for different application. More details listed below.

Besides, user can choose desired oscillator configuration for the controller. There are four external oscillator configurations to select for generating system clock, including High/Low speed crystal, ceramic resonator or cost-saving RC. SN8A1600 also includes an internal RC oscillator for slow mode controlled by programming.

SELECTION TABLE

CHIP	ROM	RAM	Stack	Timer		I/O	Green Mode	PWM Buzzer	Wakeup Pin no.	Package
				TC0	TC1					
SN8A1602A	1K*16	48	4	V	-	14	V	-	6	Die from only
SN8A1604A	4K*16	128		-	V	24	-	1	12	SKDIP28/SOP28

FEATURES

♦ **Memory configuration**
MASK ROM size: 1K * 16-bit. (SN8A1602A)
RAM size: 48 * 8-bit. (SN8A1602A)
MASK ROM size: 4K * 16-bit. (SN8A1604A)
RAM size: 128 * 8-bit. (SN8A1604A)

♦ **I/O pin configuration**
(SN8A1602A 14 pins, SN8A1604A 24 pins)
Input only: P0
Bi-directional: P1, P2, P5
Wakeup: P0, P1
Pull-up resisters: P0, P1, P2, P5
External interrupt: P0

♦ **One 8-bit timer counters.**
(TC1 for SN8A1604A, TC0 for others)
♦ **On chip watchdog timer.**

♦ **Four levels stack buffer.**

♦ **57 powerful instructions**
Four clocks per instruction cycle
All of instructions are one word length.
Most of instructions are one cycle only.
Maximum instruction cycle is two.
All ROM area JMP instruction.
All ROM area lookup table function (MOVC)

♦ **Two interrupt sources**
One internal interrupt: TC0. (SN8A1602A)
One internal interrupt: TC1. (SN8A1604A)
One external interrupt: INT0.

♦ **One channel 8-bits PWM or Buzzer output.**
(SN8A1604A only)

♦ **Dual clock system offers four operating modes**
External high clock: RC type up to 10 MHz
External high clock: Crystal type up to 16 MHz
Internal low clock: RC type 16KHz(3V), 32KHz(5V)
Normal mode: Both high and low clock active
Slow mode: Low clock only
Sleep mode: Both high and low clock stop

Green mode: periodical wakeup by timer
(SN8A1602A Only)

♦ **Package (Chip form support)**
SKDIP28 (SN8A1604A)
SOP28 (SN8A1604A)

Note: SN8A1602A support dice form only

PIN DESCRIPTIONS

➢ *SN8A1602A*

PAD NAME	TYPE	DESCRIPTION
VDD, VSS	P	Power supply input pins for digital circuit.
RST	P/I	System reset input pin. Schmitt trigger structure, low active, normal stay to "high".
XIN	I	External oscillator input pin. RC mode from XIN.
XOUT/P1.4	I/O	External oscillator output pin. In RC mode is P1.4 I/O.
P0.0 / INT0	I	Port 0.0 and shared with INT0 trigger pin (Schmitt trigger) / Built-in pull-up resisters.
P1.0 ~ P1.4	I/O	Port 1.0~Port 1.4 bi-direction pins / Built-in pull-up resisters.
P2.0 ~ P2.7	I/O	Port 2.0~Port 2.7 bi-direction pins / Built-in pull-up resisters.

➢ *SN8A1604A*

PIN NAME	TYPE	DESCRIPTION
VDD, VSS	P	Power supply input pins.
RST/P0.3	I	System reset inputs pin. Schmitt trigger structure, active "low", normal stay to "high".
XIN	I	External oscillator input pin.
XOUT/Fcpu	I/O	External oscillator output pin. RC Mode as the Fcpu output
P0.0/INT0	I	Port 0.0 and INT0 trigger pin with Schmitt trigger structure or wakeup from sleep mode Built-in pull-up resisters.
P0.1	I	P0.1 with wakeup function / Built-in pull-up resisters.
P0.2	I	P0.2 with wakeup function. Connect 10K Ohm resister to VDD (pull high) if P0.2 is unused. Built-in pull-up resisters.
P1.0 ~ P1.7	I/O	Port 1.0 ~ Port 1.7 bi-direction pins with sleep mode wakeup function Built-in pull-up resisters.
P2.0 ~ P2.7	I/O	Port 2.0 ~ Port 2.7 bi-direction pins. Built-in pull-up resisters.
P5.0 ~ P5.3	I/O	P5.0 ~ P5.3 bi-direction pin, P5.3 as TC1 output for PWM and Buzzer function Built-in pull-up resisters.

Port1, 2 structure

➢ *Note: All of the latch output circuits are push-pull structures.*

➢ **SN8A1604A**

Port0 structure

Port1,2, 5 structure
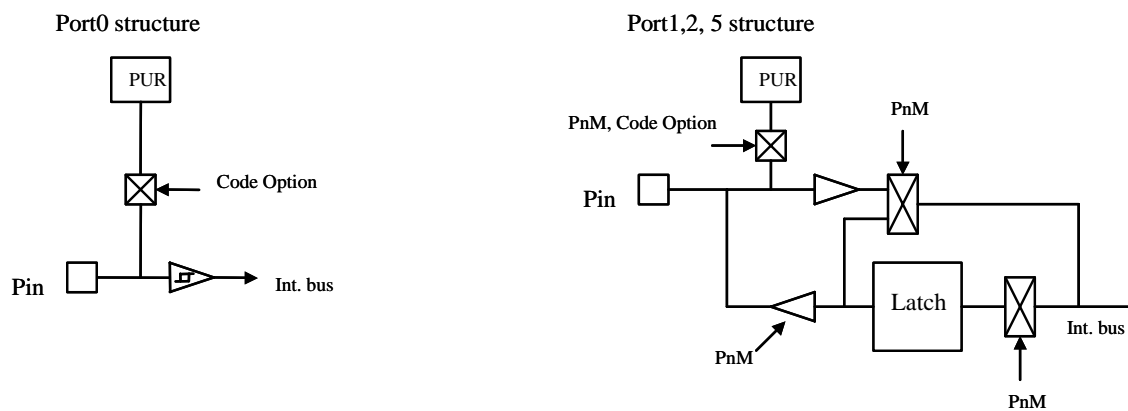

➢ *Note: The pull-up resistor can be set up by the code option in the programming phase.*

2 ADDRESS SPACES

PROGRAM MEMORY (ROM)

OVERVIEW

The SN8A1600 provides the program memory up to 1024 * 16-bit (4096 *16-bit for SN8A1604A) to be addressed and is able to fetch instructions through 10-bit wide PC (Program Counter). It can look up ROM data by using ROM code registers (R, Y, Z).

➢ 1-word reset vector addresses
➢ 1-word interrupt vector addresses
➢ 1K words general purpose area (SN8A1602A)
➢ 4K words general purpose area (SN8A1604A)
➢ 5-word reserved area

All of the program memory is partitioned into two coding areas, located from 0000H to 000FH and from 0009H to 03FEH/0FFEH. The former area is assigned for executing reset vector and interrupt vector. The later area is for storing instruction's OP-code and look-up table's data. User's program is in the last area (0009H~03FEH/0FFEH).

SN8A1604A	SN8A1602A	ROM	
0000H	0000H	*Reset vector*	User reset vector
0001H	0001H		Jump to user start address
0002H	0002H	*General purpose area*	Jump to user start address
0003H	0003H		Jump to user start address
0004H	0004H		
0005H	0005H	*Reserved*	
0006H	0006H		
0007H	0007H		
0008H	0008H	*Interrupt vector*	User interrupt vector
0009H	0009H		User program
.	.		
.	.		
000FH	000FH		
0010H	0010H	*General purpose area*	
0011H	0011H		
.	.		
.	.		
0FFEH	03FEH		End of user program
0FFFH	03FFH	*Reserved*	

USER RESET VECTOR ADDRESS (0000H)

A 1-word vector address area is used to execute system reset. After power on reset or watchdog timer overflow reset, then the chip will restart the program from address 0000h and all system registers will be set as default values. The following example shows the way to define the reset vector in the program memory.

⮑ **Example: After power on reset, external reset active or reset by watchdog timer overflow.**

CHIP SN8A1602A

```
                ORG     0               ; 0000H
                JMP     START           ; Jump to user program address.
                .                       ; 0004H ~ 0007H are reserved

                ORG     10H
START:                                  ; 0010H, The head of user program.
                .                       ; User program
                .
                .
                .
                ENDP                    ; End of program
```

INTERRUPT VECTOR ADDRESS (0008H)

A 1-word vector address area is used to execute interrupt request. If any interrupt service executes, the program counter (PC) value is stored in stack buffer and jump to 0008h of program memory to execute the vectored interrupt. Users have to define the interrupt vector. The following example shows the way to define the interrupt vector in the program memory.

⮑ **Example 1: This demo program includes interrupt service routine and the user program is behind the interrupt service routine.**

CHIP SN8A1602A
```
.DATA           PFLAGBUF
.CODE
                ORG     0               ; 0000H
                JMP     START           ; Jump to user program address.
                .                       ; 0004H ~ 0007H are reserved

                ORG     8               ; Interrupt service routine
                B0XCH   A, ACCBUF       ; B0XCH doesn't change C, Z flag
                B0MOV   A, PFLAG
                B0MOV   PFLAGBUF, A     ; Save PFLAG register in a buffer
                .
                .
                B0MOV   A, PFLAGBUF
                B0MOV   PFLAG, A        ; Restore PFLAG register from buffer
                B0XCH   A, ACCBUF       ; B0XCH doesn't change C, Z flag
                RETI                    ; End of interrupt service routine

START:                                  ; The head of user program.
                .                       ; User program
                .
                JMP     START           ; End of user program

                ENDP                    ; End of program
```

➲ **Example 2: The demo program includes interrupt service routine and the address of interrupt service routine is in a special address of general-purpose area.**

```
CHIP SN8A1602A
.DATA          PFLAGBUF
.CODE
                    ORG      0              ; 0000H
                    JMP      START          ; Jump to user program address.
                    .                       ; 0001H ~ 0007H are reserved

                    ORG      08
                    JMP      MY_IRQ         ; 0008H, Jump to interrupt service routine address

                    ORG      10H
START:                                      ; 0010H, The head of user program.
                    .                       ; User program
                    .
                    .
                    JMP      START          ; End of user program

MY_IRQ:                                     ;The head of interrupt service routine
                    B0XCH    A, ACCBUF      ; B0XCH doesn't change C, Z flag
                    B0MOV    A, PFLAG
                    B0MOV    PFLAGBUF, A    ; Save PFLAG register in a buffer
                    .
                    .
                    B0MOV    A, PFLAGBUF
                    B0MOV    PFLAG, A       ; Restore PFLAG register from buffer
                    B0XCH    A, ACCBUF      ; B0XCH doesn't change C, Z flag
                    RETI                    ; End of interrupt service routine

                    ENDP                    ; End of program
```

➢ *Remark: It is easy to get the rules of SONIX program from demo programs given above. These points are as following.*

1. The address 0000H is a "JMP" instruction to make the program go to general-purpose ROM area. The 0004H~0007H are reserved. Users have to skip 0004H~0007H addresses. It is very important and necessary.

➢ *2. The interrupt service starts from 0008H. Users can put the whole interrupt service routine from 0008H (Example1) or to put a "JMP" instruction in 0008H then place the interrupt service routine in other general-purpose ROM area (Example2) to get more modularized coding style.*

GENERAL PURPOSE PROGRAM MEMORY AREA

The 1017/4089-word at ROM locations 0009H~03FEH/0FFEH are used as general-purpose memory. The area is stored instruction's op-code and look-up table data. The SN8A1600 includes jump table function by using program counter (PC) and look-up table function by using ROM code registers (R, Y, Z).

The boundary of program memory is separated by the high-byte program counter (PCH) every 100H. In jump table function and look-up table function, the program counter can't leap over the boundary by program counter automatically. Users need to modify the PCH value to "PCH+1" when the PCL overflows (from 0FFH to 000H).

LOOK-UP TABLE DESCRIPTION

In the ROM's data lookup function, Y register is pointed to the bit 8~bit 15 and Z register to the bit 0~bit 7 data of ROM address. After MOVC instruction is executed, the low-byte data of ROM then will be stored in ACC and high-byte data stored in R register.

⮥ **Example: To look up the ROM data located "TABLE1".**

```
                B0MOV     Y, #TABLE1$M      ; To set lookup table1's middle address
                B0MOV     Z, #TABLE1$L      ; To set lookup table1's low address.
                MOVC                        ; To lookup data, R = 00H, ACC = 35H
                                            ;
                                            ; Increment the index address for next address
                INCMS     Z                 ; Z+1
                JMP       @F                ; Not overflow
                INCMS     Y                 ; Z overflow (FFH → 00), → Y=Y+1
                NOP                         ; Not overflow
                                            ;
    @@:         MOVC                        ; To lookup data, R = 51H, ACC = 05H.
                .         .                 ;
    TABLE1:     DW        0035H             ; To define a word (16 bits) data.
                DW        5105H             ; "
                DW        2012H             ; "
```

➢ **CAUSION: The Y register can't increase automatically if Z register cross boundary from 0xFF to 0x00. Therefore, user must take care such situation to avoid loop-up table errors. If Z register overflow, Y register must be added one. The following INC_YZ macro shows a simple method to process Y and Z registers automatically.**

➢ *Note: Because the program counter (PC) is only 12-bit, the X register is useless in the application. Users can omit "B0MOV X, #TABLE1$H". SONiX ICE support more larger program memory addressing capability. So make sure X register is "0" to avoid unpredicted error in loop-up table operation.*

⮥ **Example: INC_YZ Macro**

```
INC_YZ          MACRO
                INCMS     Z                 ; Z+1
                JMP       @F                ; Not overflow

                INCMS     Y                 ; Y+1
                NOP                         ; Not overflow
@@:
                ENDM
```

The other coding style of loop-up table is to add Y or Z index register by accumulator. Be careful if carry happen. Refer following example for detailed information:

⮂ **Example: Increase Y and Z register by B0ADD/ADD instruction**

```
                B0MOV     Y, #TABLE1$M     ; To set lookup table's middle address.
                B0MOV     Z, #TABLE1$L     ; To set lookup table's low address.

                B0MOV     A, BUF           ; Z = Z + BUF.
                B0ADD     Z, A

                B0BTS1    FC               ; Check the carry flag.
                JMP       GETDATA          ; FC = 0
                INCMS     Y                ; FC = 1. Y+1.
                NOP

GETDATA:                                   ;
                MOVC                       ; To lookup data. If BUF = 0, data is 0x0035
                                           ; If BUF = 1, data is 0x5105
                                           ; If BUF = 2, data is 0x2012
                                           .
                                           .
                .         .                ;
TABLE1:         DW        0035H            ; To define a word (16 bits) data.
                DW        5105H            ; "
                DW        2012H            ; "
```

JUMP TABLE DESCRIPTION

The jump table operation is one of multi-address jumping function. Add low-byte program counter (PCL) and ACC value to get one new PCL. The new program counter (PC) points to a series jump instructions as a listing table. The way is easy to make a multi-stage program.

When carry flag occurs after executing of "ADD PCL, A", it will not affect PCH register. Users have to check if the jump table leaps over the ROM page boundary or the listing file generated by SONIX assembly software. If the jump table leaps over the ROM page boundary (e.g. from xxFFH to xx00H), move the jump table to the top of next program memory page (xx00H). **Here one page mean 256 words.**

➲   **Example :**

```
ORG        0X0100          ; The jump table is from the head of the ROM boundary

B0ADD      PCL, A          ; PCL = PCL + ACC, the PCH can't be changed.
JMP        A0POINT         ; ACC = 0, jump to A0POINT
JMP        A1POINT         ; ACC = 1, jump to A1POINT
JMP        A2POINT         ; ACC = 2, jump to A2POINT
JMP        A3POINT         ; ACC = 3, jump to A3POINT
```

In following example, the jump table starts at 0x00FD. When execute B0ADD PCL, A. If ACC = 0 or 1, the jump table points to the right address. If the ACC is larger then 1 will cause error because PCH doesn't increase one automatically. We can see the PCL = 0 when ACC = 2 but the PCH still keep in 0. The program counter (PC) will point to a wrong address 0x0000 and crash system operation. It is important to check whether the jump table crosses over the boundary (xxFFH to xx00H). A good coding style is to put the jump table at the start of ROM boundary (e.g. 0100H).

➲   **Example: If "jump table" crosses over ROM boundary will cause errors.**

ROM Address

```
     .              .
     .              .
     .              .
  0X00FD      B0ADD      PCL, A      ; PCL = PCL + ACC, the PCH can't be changed.
  0X00FE      JMP        A0POINT     ; ACC = 0
  0X00FF      JMP        A1POINT     ; ACC = 1
  0X0100      JMP        A2POINT     ; ACC = 2   ← jump table cross boundary here
  0X0101      JMP        A3POINT     ; ACC = 3
     .              .
     .              .
```

SONIX provides a macro for safe jump table function. This macro will check the ROM boundary and move the jump table to the right position automatically. The side effect of this macro maybe wastes some ROM size.

```
@JMP_A          MACRO      VAL
                IF         (($+1) !& 0XFF00) !!= (($+(VAL)) !& 0XFF00)
                JMP        ($ | 0XFF)
                ORG        ($ | 0XFF)
                ENDIF
                ADD        PCL, A
                ENDM
```

➢   *Note: "VAL" is the number of the jump table listing number.*

➲ **Example: "@JMP_A" application in SONIX macro file called "MACRO3.H".**

```
            B0MOV      A, BUF0            ; "BUF0" is from 0 to 4.
            @JMP_A     5                 ; The number of the jump table listing is five.
            JMP        A0POINT           ; If ACC = 0, jump to A0POINT
            JMP        A1POINT           ; ACC = 1, jump to A1POINT
            JMP        A2POINT           ; ACC = 2, jump to A2POINT
            JMP        A3POINT           ; ACC = 3, jump to A3POINT
            JMP        A4POINT           ; ACC = 4, jump to A4POINT
```

If the jump table position is from 00FDH to 0101H, the "@JMP_A" macro will make the jump table to start from 0100h.

DATA MEMORY (RAM)

OVERVIEW

The SN8A1600 has internally built-in data memory up to 48/128 bytes for storing the general-purpose data.

➢ 48 * 8-bit general purpose area in bank 0 (SN8A1602A)
➢ 128 * 8-bit general purpose area in bank 0 (SN8A1604A)
➢ 128 * 8-bit system register area

The memory is separated into bank 0. The bank 0 uses the first 48/128 bytes as general-purpose area, and the remaining 128 bytes as system register.

	SN8A1604A	SN8A1602A	RAM location	
	000h	000h		000h~02FH/07FH of Bank 0 store general-purpose data (48 bytes /128bytes).
	"	"		
	"	"		
	"	"	*General purpose area*	
	"	"		
	"	"		
	07Fh	02Fh		
BANK 0	080h	080h		080h~0FFh of Bank 0 store system registers (128 bytes).
	"	"		
	"	"	*System register*	
	"	"		
	"	"		
	"	"		
	0FFh	0FFh	*End of bank 0 area*	

➢ *Note: The undefined locations of system register area are logic "high" after executing read instruction "MOV A, M".*

WORKING REGISTERS

The RAM bank0 locations 82H to 84H store the specially defined registers such as register R, Y, Z, respectively shown in the following table. These registers can use as the general-purpose working buffer or access ROM's and RAM's data. For instance, all of the ROM table can be looked-up by R, Y and Z registers. The data of RAM memory can be indirectly accessed with Y and Z registers.

	082H	083H	084H
RAM	R	Z	Y
	R/W	R/W	R/W

Y, Z REGISTERS

The Y and Z registers are the 8-bit buffers. There are three major functions of these registers. First, Y and Z registers can be used as working registers. Second, these two registers can be used as data pointers for @YZ register. Third, the registers can address ROM location to look up ROM data.

084H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Y	YBIT7	YBIT6	YBIT5	YBIT4	YBIT3	YBIT2	YBIT1	YBIT0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

083H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Z	ZBIT7	ZBIT6	ZBIT5	ZBIT4	ZBIT3	ZBIT2	ZBIT1	ZBIT0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

The @YZ that is data point_1 index buffer located at address 0E7H in RAM bank 0. It employs Y and Z registers to addressing RAM location to read/write data through ACC. The Lower 4-bit of Y register points to RAM bank number and Z register to RAM address number, respectively. The higher 4-bit data of Y register is truncated in RAM indirectly access mode.

⊃ **Example: Following example uses indirectly addressing mode to access data in the RAM address 025H of bank0.**

```
                    B0MOV    Y, #00H          ; To set RAM bank 0 for Y register
                    B0MOV    Z, #25H          ; To set location 25H for Z register
                    B0MOV    A, @YZ           ; To read a data into ACC
```

⊃ **Example: Clear general-purpose data memory area of bank 0 using @YZ register.**

```
                    B0MOV    Y, #0            ; Y = 0, bank 0
                    B0MOV    Z, #07FH         ; Y = 7FH, the last address of the data memory area

CLR_YZ_BUF:
                    CLR      @YZ             ; Clear @YZ to be zero

                    DECMS    Z               ; Y – 1, if Y= 0, finish the routine
                    JMP      CLR_YZ_BUF      ; Not zero

                    CLR      @YZ
END_CLR:                                     ; End of clear general purpose data memory area of bank 0
                    .
```

➢ *Note: Please consult the "LOOK-UP TABLE DESCRIPTION" about Y, Z register look-up table application.*

R REGISTERS

R register is an 8-bit buffer. There are two major functions of the register. First, R register can be used as working register. Second, the R register stores high-byte data of look-up ROM data. After MOVC instruction executed, the high-byte data of specified ROM address will store in R register and the low-byte data in ACC.

082H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
R	RBIT7	RBIT6	RBIT5	RBIT4	RBIT3	RBIT2	RBIT1	RBIT0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

➢ *Note: Please consult the "LOOK-UP TABLE DESCRIPTION" about R register look-up table application.*

PROGRAM FLAG

The PFLAG includes carry flag (C), decimal carry flag (DC) and zero flag (Z). If the result of operating is zero or there is carry, borrow occurrence, then these flags will be set to PFLAG register.

086H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PFLAG	-	-	-	-	-	C	DC	Z
Read/Write	-	-	-	-	-	R/W	R/W	R/W
After reset	-	-	-	-	-	0	0	0

CARRY FLAG

C = 1: When executed arithmetic addition with overflow or executed arithmetic subtraction without borrow or executed rotation instruction with logic "1" shifting out.
C = 0: When executed arithmetic addition without overflow or executed arithmetic subtraction with borrow or executed rotation instruction with logic "0" shifting out.

DECIMAL CARRY FLAG

DC = 1: If executed arithmetic addition with overflow of low nibble or executed arithmetic subtraction without borrow of low nibble.
DC = 0: If executed arithmetic addition without overflow of low nibble or executed arithmetic subtraction with borrow of low nibble.

ZERO FLAG

Z = 1: When the content of ACC or target memory is zero after executing instructions involving a zero flag.
Z = 0: When the content of ACC or target memory is not zero after executing instructions involving a zero flag.

ACCUMULATOR

The ACC is an 8-bit data register responsible for transferring or manipulating data between ALU and data memory. If the result of operating is zero (Z) or there is carry (C or DC) occurrence, then these flags will be set to PFLAG register.

ACC is not in data memory (RAM), so ACC can't be access by "B0MOV" instruction. Execute "MOV" to read/write ACC value.

➲ **Example: Read and write ACC value.**

; Read ACC data and store in BUF data memory

        MOV   BUF, A

        .   .

; Write a immediate data into ACC

        MOV   A, #0FH

; Write ACC data from BUF data memory

        MOV   A, BUF

The system doesn't store ACC and PFLAG value when interrupt executed. ACC and PFLAG data must be exchanged to other data memories defined by users. Thus, once interrupt occurs, these data must be stored in the data memory based on the user's program as follows.

➲ **Example: Protect ACC and working registers.**

```
ACCBUF        EQU      00H              ; ACCBUF is ACC data buffer.
PFLAGBUF      EQU      01H              ; PFLAGBUF is PFLAG data buffer.

INT_SERVICE:
              B0XCH    A, ACCBUF        ; Store ACC value
              B0MOV    A, PFLAG         ; Store PFLAG value
              B0MOV    PFLAGBUF,A

              .        .
              .
              .

              B0MOV    A, PFLAGBUF      ; Re-load PFLAG value
              B0MOV    PFLAG,A
              B0XCH    A, ACCBUF        ; Re-load ACC

              RETI                      ; Exit interrupt service vector
```

➢ *Note: To save and re-load ACC data must be used "B0XCH" instruction, or the PLAGE value maybe modified by ACC.*

STACK OPERATIONS

OVERVIEW

The stack buffer of SN8A1600 has 4-level high area and each level is 10-bit length. These buffers are designed to push and pop up program counter's (PC) data when interrupt service routine is executed. The STKP register is a pointer designed to point active level in order to push or pop up data from stack buffer of kernel circuit. The STKnH and STKnL are the 10-bit stack buffers to store program counter (PC) data.
STACK REGISTERS

The stack pointer (STKP) is a 3-bit register to store the address used to access the stack buffer, 10-bit data memory (STKnH and STKnL) set aside for temporary storage of stack addresses.

The two stack operations are writing to the top of the stack (push) and reading from the top of stack (pop). Push operation decrements the STKP and the pop operation increments each time. That makes the STKP always point to the top address of stack buffer and write the last program counter value (PC) into the stack buffer.

The program counter (PC) value is stored in the stack buffer before a CALL instruction executed or during interrupt service routine. Stack operation is a LIFO type (Last in and first out). The stack pointer (STKP) and stack buffer (STKnH and STKnL) are located in the system register area bank 0.

0DFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
STKP	GIE	-	-	-	-	STKPB2	STKPB1	STKPB0
Read/Write	R/W	-	-	-	-	R/W	R/W	R/W
After reset	0	-	-	-	-	1	1	1

STKPBn: Stack pointer. (n = 0 ~ 2)
GIE: Global interrupt control bit. 0 = disable, 1 = enable. There is more on this in interrupt chapter.

➲ **Example: Stack pointer (STKP) reset routine.**

```
MOV      A, #00000111B
B0MOV    STKP, A
```

STKn = <STKnH , STKnL> (n = 3H ~ 0H)

➢ **SN8A1602A**

After reset	0	0	0	0	0	0	0	0

STKnH: Store PCH data as interrupt or call executing. The n expressed 8 ~11.
STKnL: Store PCL data as interrupt or call executing. The n expressed 0 ~7.

STACK OPERATION EXAMPLE

The two kinds of Stack-Save operations refer to the stack pointer (STKP) and write the content of program counter (PC) to the stack buffer are CALL instruction and interrupt service. Under each condition, the STKP decreases and points to the next available stack location. The stack buffer stores the program counter about the op-code address. The Stack-Save operation is as the following table.

Stack Level	STKP Register			Stack Buffer		Description
	STKPB2	STKPB1	STKPB0	High Byte	Low Byte	
0	1	1	1	Free	Free	-
1	1	1	0	STK0H	STK0L	-
2	1	0	1	STK1H	STK1L	-
3	1	0	0	STK2H	STK2L	-
4	0	1	1	STK3H	STK3L	-
> 4	0	1	0	-	-	**Stack Over, error**

There are Stack-Restore operations correspond to each push operation to restore the program counter (PC). The RETI instruction uses for interrupt service routine. The RET instruction is for CALL instruction. When a pop operation occurs, the STKP is incremented and points to the next free stack location. The stack buffer restores the last program counter (PC) to the program counter registers. The Stack-Restore operation is as the following table.

Stack Level	STKP Register			Stack Buffer		Description
	STKPB2	STKPB1	STKPB0	High Byte	Low Byte	
4	0	1	0	STK3H	STK3L	-
3	1	0	0	STK2H	STK2L	-
2	1	0	1	STK1H	STK1L	-
1	1	1	0	STK0H	STK0L	-
0	1	1	1	Free	Free	-

PROGRAM COUNTER

The program counter (PC) is a 10-bit binary counter separated into the high-byte 2 bits and the low-byte 8 bits. This counter is responsible for pointing a location in order to fetch an instruction for kernel circuit. Normally, the program counter is automatically incremented with each instruction during program execution.

Besides, it can be replaced with specific address by executing CALL or JMP instruction. When JMP or CALL instruction is executed, the destination address will be inserted to bit 0 ~ bit 9.

	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PC	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
After reset	-	-	-	-	-	-	0	0	0	0	0	0	0	0	0	0
	PCH								PCL							

ONE ADDRESS SKIPPING

There are 9 instructions (CMPRS, INCS, INCMS, DECS, DECMS, BTS0, BTS1, B0BTS0, B0BTS1) with one address skipping function. If the result of these instructions is matched, the PC will add 2 steps to skip next instruction.

If the condition of bit test instruction is matched, the PC will add 2 steps to skip next instruction.

```
          B0BTS1   FC              ; To skip, if Carry_flag = 1
          JMP      C0STEP          ; Else jump to C0STEP.
          .
C0STEP:   NOP

          B0MOV    A, BUF0         ; Move BUF0 value to ACC.
          B0BTS0   FZ              ; To skip, if Zero flag = 0.
          JMP      C1STEP          ; Else jump to C1STEP.
          .
C1STEP:   NOP
```

If the ACC is equal to the immediate data or memory, the PC will add 2 steps to skip next instruction.

```
          CMPRS    A, #12H         ; To skip, if ACC = 12H.
          JMP      C0STEP          ; Else jump to C0STEP.
          .
C0STEP:   NOP
```

If the result after increasing or decreasing by 1 is 0xffh or 0x00h, the PC will add 2 steps to skip next instruction.

INCS instruction:
```
          INCS     BUF0            ; To skip, if BUF0 = 0X00H.
          JMP      C0STEP          ; Else jump to C0STEP.
          .
C0STEP:   NOP
```

INCMS instruction:
```
          INCMS    BUF0            ; To skip, if BUF0 = 0X00H.
          JMP      C0STEP          ; Else jump to C0STEP.
          .
C0STEP:   NOP
```

DECS instruction:
```
          DECS     BUF0            ; To skip, if BUF0 = 0XFFH.
          JMP      C0STEP          ; Else jump to C0STEP.
          .
C0STEP:   NOP
```

DECMS instruction:
```
          DECMS    BUF0            ; To skip, if BUF0 = 0XFFH.
          JMP      C0STEP          ; Else jump to C0STEP.
          .
C0STEP:   NOP
```

MULTI-ADDRESS JUMPING

Users can jump round multi-address by either JMP instruction or ADD M, An instruction (M = PCL) to activate multi-address jumping function. If carry flag occurs after execution of ADD PCL, A, the carry flag will not affect PCH register.

⮞   **Example: If PC = 0323H   (PCH = 03H、PCL = 23H)**

```
; PC = 0323H
                MOV        A, #28H
                B0MOV      PCL, A              ; Jump to address 0328H
                .          .
                .          .
; PC = 0328H    .          .
                MOV        A, #00H
                B0MOV      PCL, A              ; Jump to address 0300H
```

⮞   **Example: If PC = 0323H   (PCH = 03H、PCL = 23H)**

```
; PC = 0323H
                B0ADD      PCL, A              ; PCL = PCL + ACC, the PCH cannot be changed.
                JMP        A0POINT             ; If ACC = 0, jump to A0POINT
                JMP        A1POINT             ; ACC = 1, jump to A1POINT
                JMP        A2POINT             ; ACC = 2, jump to A2POINT
                JMP        A3POINT             ; ACC = 3, jump to A3POINT
                .          .                   ;
```

3 ADDRESSING MODE

OVERVIEW

The SN8A1600 provides three addressing modes to access RAM data, including immediate addressing mode, directly addressing mode and indirectly address mode. The main purpose of the three different modes is described in the following table.

IMMEDIATE ADDRESSING MODE

The immediate addressing mode uses an immediate data to set up the location (" MOV   A, # I ", " B0MOV   M, # I ") in ACC or specific RAM.

Immediate addressing mode

```
MOV        A, #12H            ; To set an immediate data 12H into ACC
```

DIRECTLY ADDRESSING MODE

The directly addressing mode uses address number to access memory location (" MOV   A,12H ", " MOV   12H, A ").

Directly addressing mode

```
B0MOV      A, 12H             ; To get a content of location 12H of bank 0 and save in ACC
```

INDIRECTLY ADDRESSING MODE

The indirectly addressing mode is to set up an address in data pointer registers (Y/Z) and uses MOV instruction to read/write data between ACC and @YZ register (" MOV   A,@YZ ", " MOV   @YZ, A ").

➲   **Example: Indirectly addressing mode with @YZ register**

```
CLR        Y             ; To clear Y register to access RAM bank 0.
B0MOV      Z, #12H       ; To set an immediate data 12H into Z register.
B0MOV      A, @YZ        ; Use data pointer @YZ reads a data from RAM location
                         ; 012H into ACC.
```

4 SYSTEM REGISTER

OVERVIEW

The RAM area located in 80H~FFH bank 0 is system register area. The main purpose of system registers is to control peripheral hardware of the chip. Using system registers can control I/O ports, timers and counters by programming. The memory map provides an easy and quick reference source for writing application program. These system registers accessing is controlled by the selected memory bank (RBANK = 0) or the bank 0 read/write instruction (B0MOV, B0BSET, B0BCLR…).

Description

PFLAG = ROM page and special flag register.
P1W = Port 1 wakeup register.
PnM = Port n input/output mode register.
INTRQ = Interrupt request register.
OSCM = Oscillator mode register.
TCnM = Timer n mode register.
T0M.1= TC0GN, TC0 green mode wakeup flag.
STKP = Stack pointer buffer.
@YZ = RAM YZ indirect addressing index pointer.

R = Working register and ROM look-up data buffer.
Y, Z = Working, @YZ and ROM addressing register.
Pn = Port n data buffer.
INTEN = Interrupt enable register.
PCH, PCL = Program counter.
TCnC = Timer n counting register.
TC1R= TC1 8-bit reload register.
STK0~STK3 = Stack 0 ~ stack 3 buffer.

➢ *Note:*

       a). All register names had been declared in SN8ASM assembler.
       b). 1-bit register name had been declared in SN8ASM assembler with "F" prefix code.
       c). When using instruction to check empty location, logic "H" will be returned.
       d). "b0bset", "b0bclr", "bset", "bclr" instructions only support "R/W" registers.

BITS of SYSTEM REGISTER

➢ *SN8A1602A system register table*

  a): To avoid system error, please sure to put all the "0" as it indicates in the above table.
  b). All of register names had been declared in SN8ASM assembler.
  c). One-bit name had been declared in SN8ASM assembler with "F" prefix code.
  d). "b0bset", "b0bclr", "bset", "bclr" of instructions just only support "R/W" registers.

SYSTEM REGISTER DESCRIPTION

R – Working Register

082H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
R	RBIT7	RBIT6	RBIT5	RBIT4	RBIT3	RBIT2	RBIT1	RBIT0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

Function:
1. Working register.

2. After MOVC instruction executed, the high-byte data of specified ROM address will store in R register and the

low-byte data in ACC.

Z – Working Register

083H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Z	ZBIT7	ZBIT6	ZBIT5	ZBIT4	ZBIT3	ZBIT2	ZBIT1	ZBIT0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

Function:
1. Working register.
2. Index pointer addressing low byte address.
3. Look-up table function to address low byte address.

Y – Working Register

084H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Y	YBIT7	YBIT6	YBIT5	YBIT4	YBIT3	YBIT2	YBIT1	YBIT0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

Function:

    1. Working register.

    2. Index pointer addressing middle byte address.

    3. Look-up table function to address middle byte address.

PFLAG – Working Register

086H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PFLAG	-	-	-	-	-	C	DC	Z
Read/Write	-	-	-	-	-	R/W	R/W	R/W
After reset	-	-	-	-	-	0	0	0

Bit3~Bit7   **Undefined**

C   **Carry Flag**

0	Executed arithmetic addition without occurring carry signal. Executed arithmetic subtraction with borrowing signal. Executed rotation instruction with shifting out logic "0".
1	Executed arithmetic addition with occurring carry signal. Executed arithmetic subtraction without borrowing signal. Executed rotation instruction with shifting out logic "1".

D   **Decimal Carry Flag**

0	Executed arithmetic addition without occurring signal from low nibble. Executed arithmetic subtraction with borrow signal from high nibble.
1	Executed arithmetic addition with occurring signal from low nibble. Executed arithmetic subtraction without borrow signal from high nibble.

Z   **Zero Flag**

0	After operation, the content of ACC is not zero.
1	After operation, the content of ACC is zero.

PUR – I/O PORT Pull-Up Register

➢ **SN8A1602A**

0BEH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PUR	-	-	-	-	-	PUR2	PUR1	PUR0
Read/Write	-	-	-	-	-	W	W	W
After reset	-	-	-	-	-	0	0	0

➢ **SN8A1604A**

0BEH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PUR	-	-	PUR5	-	-	PUR2	PUR1	PUR0
Read/Write	-	-	W	-	-	W	W	W
After reset	-	-	0	-	-	0	0	0

➢ **SN8A1604A**

PUR5

Port 5 Pull-up Control Bit

0	Disable port 5 pull-up function
1	Enable port 5 pull-up function

PUR2

Port 2 Pull-up Control Bit

0	Disable port 2 pull-up function
1	Enable port 2 pull-up function

PUR1

Port 1 Pull-up Control Bit

0	Disable port 1 pull-up function
1	Enable port 1 pull-up function

PUR0

Port 5 Pull-up Control Bit

0	Disable port 0 pull-up function
1	Enable port 0 pull-up function

PEDGE – I/O PORT Pull-Up Register

0BFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PEDGE	PEDGEN	-	-	P00G1	P00G0	-	-	-
Read/Write	W	-	-	W	W	-	-	-
After reset	0	-	-	0	0	-	-	-

Bit0~Bit2,Bit5,Bit6   **Undefine**

PEDGEN

Edge Trigger Control Bit

0	P0.0 and P0.1 interrupt or wakeup by the falling edge. P1 wakeup by the low level.
1	P0.0 interrupt or wakeup controlled by <P00G1,P00G0>. P0.1 interrupt or wakeup by the input level change. P1 wakeup by the input level change.

<P00G1,P00G0>   P0.0 Edge Trigger Control Bit for Interrupt or Wakeup Function

00	Reserved.
01	Falling edge.
10	Rising edge.
11	Level change trigger.

P1W – Port 1 Wakeup Function Register

➢ **SN8A1602A**

0C0H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P1W	0	0	0	P14W	P13W	P12W	P11W	P10W
Read/Write	-	-	-	R/W	R/W	R/W	R/W	R/W
After reset	-	-	-	0	0	0	0	0

➢ **SN8A1604A**

0C0H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P1W	P17W	P16W	P15W	P14W	P13W	P12W	P11W	P10W
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

➢ **SN8A1602A**

Bit7~Bit5   **Undefine**

➢ **SN8A1604A**

P17W~P15W   **Bit 7~Bit5 of Port 1 Wakeup Function Control Bit**

0	Disable P1.7~P1.5 wakeup function.
1	Enable P1.7~P1.5 wakeup function.

P14W~P10W   **Bit 4~Bit0 of Port 1 Wakeup Function Control Bit**

0	Disable P1.4~P1.0 wakeup function.
1	Enable P1.4~P1.0 wakeup function.

P1M – Port 1 Input/Output Direction Register

➢ *SN8A1602A*

0C1H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P1M	0	0	0	P14M	P13M	P12M	P11M	P10M
Read/Write	-	-	-	R/W	R/W	R/W	R/W	R/W
After reset	-	-	-	0	0	0	0	0

➢ *SN8A1604A*

P1M	P17M	P16M	P15M	P14M	P13M	P12M	P11M	P10M
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

➢ *SN8A1602A*

Bit5~Bit7   **Undefined**

➢ *SN8A1604A*
P17W~P15W   **Bit 7~Bit5 of Port 1 Input/Output Direction Control Bit**

0	Set P1.7~P1.5 to input direction.
1	Set P1.7~P1.5 to output direction.

P14M~P10M   **Bit 4~Bit0 of Port 1 Input/Output Direction Control Bit**

0	Set P1.4~P1.0 to input direction.
1	Set P1.4~P1.0 to output direction.

P2M – Port 2 Input/Output Direction Register

0C2H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P2M	P27M	P26M	P25M	P24M	P23M	P22M	P21M	P20M
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

P27M~P20M

Bit 7~Bit0 of Port 2 Input/Output Direction Control Bit

0	Set P2.7~P2.0 to input direction.
1	Set P2.7~P2.0 to output direction.

P5M – Port 5 Input/Output Direction Register (SN8A1604A Only)

0C5H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P5M	0	0	0	0	P53M	P52M	P51M	P50M
Read/Write	-	-	-	-	R/W	R/W	R/W	R/W
After reset	-	-	-	-	0	0	0	0

Bit7~Bit4   **Undefined**

P53M~P50M   **Bit 3~Bit0 of Port 5 Input/Output Direction Control Bit**

0	Set P5.3~P5.0 to input direction.
1	Set P5.3~P5.0 to output direction.

INTRQ – Interrupt Request Register

➢ **SN8A1602A**

0C8H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
INTRQ	0	0	TC0IRQ	0	0	0	0	P00IRQ
Read/Write	-	-	R/W	-	-	-	-	R/W
After reset	-	-	0	-	-	-	-	0

➢ **SN8A1604A**

0C8H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
INTRQ	0	TC1IRQ	0	0	0	0	0	P00IRQ
Read/Write	-	R/W	-	-	-	-	-	R/W
After reset	-	0	-	-	-	-	-	0

Bit7,4~1   **Undefined**

TC0IRQ   **TC0 Interrupt Request Flag**

0	No interrupt Request.
1	Occur Interrupt Request.

TC1IRQ   **TC1 Interrupt Request Flag**

0	No interrupt Request.
1	Occur Interrupt Request.

P00IRQ   **P0.0 (INT0) Interrupt Request Flag**

0	No interrupt Request.
1	Occur Interrupt Request.

INTEN – Interrupt Enable Register

➢ **SN8A1602A**

0C9H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
INTEN	0	0	TC0IEN	0	0	0	0	P00IEN
Read/Write	-	-	R/W	-	-	-	-	R/W
After reset	-	-	0	-	-	-	-	0

➢ **SN8A1604A**

0C9H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
INTEN	0	TC1IEN	0	0	0	0	0	P00IEN
Read/Write	-	R/W	-	-	-	-	-	R/W
After reset	-	0	-	-	-	-	-	0

Bit7,4~1   **Undefined**

TC0IEN   **TC0 Interrupt Request Control Bit**

0	Enable interrupt Request.
1	Disable Interrupt Request.

TC1IEN   **TC1 Interrupt Request Control Bit**

0	Enable interrupt Request.
1	Disable Interrupt Request.

P00IEN   **P00 Interrupt Request Control Bit**

0	Enable interrupt Request.
1	Disable Interrupt Request.

OSCM – Oscillator Register

➢ **SN8A1602A**

0CAH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
OSCM	0	WDRST	0	CPUM1	CPUM0	CLKMD	STPHX	0
Read/Write	-	R/W	-	R/W	R/W	R/W	R/W	-
After reset	-	0	-	0	0	0	0	-

➢ **SN8A1604A**

0CAH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
OSCM	0	WDRST	0	0	CPUM0	CLKMD	STPHX	0
Read/Write	-	R/W	-	-	R/W	R/W	R/W	-
After reset	-	0	-	-	0	0	0	-

Bit0,Bit5~7   **Undefined**

WDRST   **Watchdog Timer Reset Control Bit**

0	WDT free run.
1	Clear watchdog timer counter.

<CPUM1,CPUM0>   **System Operating Mode Select Bit (SN8A1602A only)**

00	Normal mode.
01	Power down mode. (Sleep mode)
10	Green mode
11	Reserved

CLKMD   **System High/Low Speed Mode Select Bit (SN8A1602A only)**

0	Normal mode. (dual clock).
1	Internal low clock. (RC 16KHz, 3V)

STPHX   **External High Oscillator Control Bit**

0	External high oscillator free run.
1	Stop External high oscillator.

➢ *Note: The bit 7 of OSCM register must be "0", or the system will be error.*

PCL – Program Counter Low Byte Register

After reset	0	0	0	0	0	0	0	0

Function:
   1. @YZ data buffer is for indirectly addressing mode to access data. @YZ content is the RAM data indexed by Y, Z working registers.

5 POWER ON RESET

OVERVIEW

SN8A1600 provides two system resets. One is external reset and the other is low voltage detector (LVD). The external reset is a simple RC circuit connecting to the reset pin. The low voltage detector (LVD) is built-in internal circuit. When one of the reset devices occurs, the system will reset and the system registers become initial value. The timing diagram is as the following.

VDD

LVD Detect Level

External Reset

External Reset Detect Level

LVD

End of LVD Reset

Internal Reset Signal

End of External Reset
SN8A1600 power on reset timing diagram

EXTERNAL RESET DESCRIPTION

The external reset is a low level active device. The reset pin receives the low voltage and resets the system. When the voltage detects high level, it stops resetting the system. Users can use an external reset circuit to control system operation. It is necessary that the VDD must be stable.

VDD

External Reset

External Reset Detect Level

Internal Reset Signal   System Reset   End of External Reset
The external reset will fail, if the external reset voltage stabilizes before VDD voltage. Users must make sure the VDD is stable earlier than external reset. The external reset circuit is a simple RC circuit as the following figure.

R
20K ohm

VDD

RST

MCU

C
0.1uF

VSS

VCC

GND
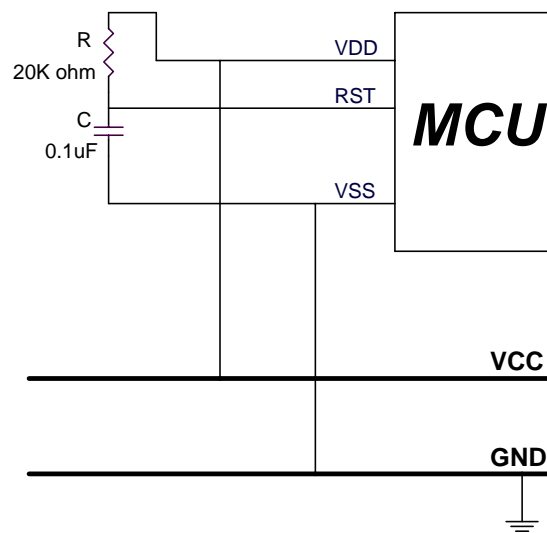

In power-fail condition as Brown-out reset. The reset pin may keep high level but the VDD is low voltage. That makes the system reset fail and chip error. To connect a diode from reset pin to VDD is a good solution. The circuit can force the capacitor to release electric charge and drop the voltage, and solve the error.
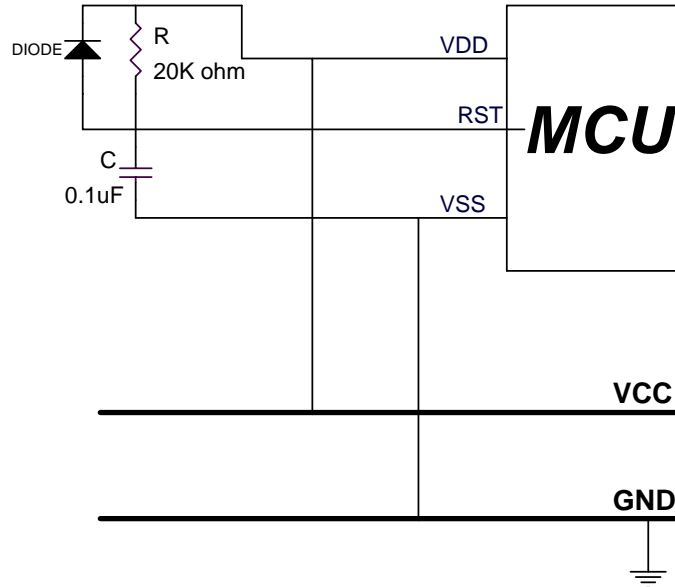

LOW VOLTAGE DETECTOR (LVD) DESCRIPTION

The LVD is a low voltage detector. It detects VDD level and reset the system as the VDD lower than the desired voltage. The detect level is 1.8V. If the VDD lower than 1.8V, the system resets. The LVD function is controlled by code option. Users can turn on it for special application like power-fail condition. LVD work with external reset function. They are OR active.
The LVD can protect system to work well under Brown-out reset, but it is a high consumptive circuit. In 3V condition, the LVD consumes about 1uA. It is a very large consumption for battery system, but supports AC system well.

➢ **Note: LVD is selected by code option.**

6 OSCILLATORS

OVERVIEW

The SN8A1600 highly performs the dual clock micro-controller system. The dual clocks are high-speed clock and low-speed clock. The high-speed clock frequency is supplied through the external oscillator circuit. The low-speed clock frequency is supplied through on-chip RC oscillator circuit.

The external high-speed clock and the internal low-speed clock can be system clock (Fosc). The system clock is divided by 4 to be the instruction cycle (Fcpu).

$$Fcpu = Fosc / 4$$

The system clock is required by the following peripheral modules:

✓ **Timer 0 (TC0)**
✓ **Watchdog timer**

CLOCK BLOCK DIAGRAM

HXRC(1:0) is code option
• 00= RC
• 01 =32 Khz Oscillator
• 10 = High Speed Oscillator (>10Mhz)
• 11 = Standard Oscillator (4Mhz)

Divided by 2
1 : Disable
0 : Enable

OSG : Oscillator Safe Guard
1 : Disable -- System Default
0 : Enable
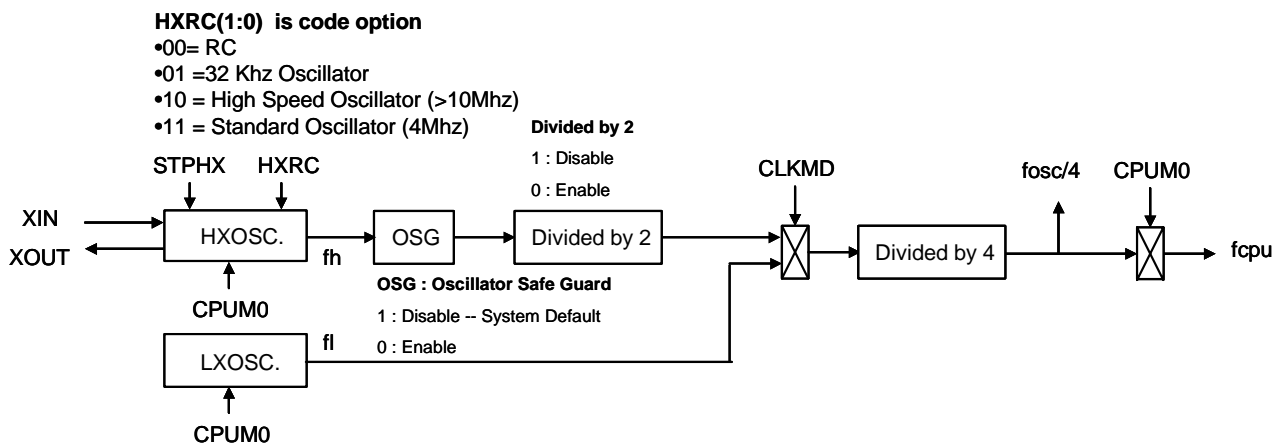

➢ HXOSC: External high-speed clock.
➢ LXOSC: Internal low-speed clock.
➢ OSG: Oscillator safe guard.

OSCM REGISTER DESCRIPTION

The OSCM register is an oscillator control register. It controls oscillator selection, system mode, watchdog timer clock rate.

0CAH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
OSCM	0	WDRST	0	CPUM1	CPUM0	CLKMD	STPHX	0
Read/Write	-	R/W	-	R/W	R/W	R/W	R/W	-
After reset	-	0	-	0	0	0	0	-

STPHX: Eternal high-speed oscillator control bit. 0 = free run, 1 = stop. This bit only controls external high-speed oscillator. If STPHX=1, the internal low-speed RC oscillator is still running.
CLKMD: System high/Low speed mode select bit. 0 = normal (dual) mode, 1 = slow mode.
CPUM0: CPU operating mode control bit. 0 = normal, 1 = sleep (power down) mode to turn off both high/low clock.

WDRST is watchdog timer control bits. The detail information is in watchdog timer chapter.

➢ *Note: The bit 7 of OSCM register must be "0", or the system will be error.*

EXTERNAL HIGH-SPEED OSCILLATOR

SN8A1600 can be operated in four different oscillator modes. There are external RC oscillator modes, high crystal/resonator mode (12M code option), standard crystal/resonator mode (4M code option) and low crystal mode (32K code option). For different application, the users can select one of satiable oscillator mode by programming code option to generate system high-speed clock source after reset.

⊃   **Example: Stop external high-speed oscillator.**

                B0BSET   FSTPHX   ; To stop external high-speed oscillator only.

                B0BSET   FCPUM0   ; To stop external high-speed oscillator and internal low-speed
                                                        ; oscillator called power down mode (sleep mode).

OSCILLATOR MODE CODE OPTION

SN8A1600 has four oscillator modes for different applications. These modes are 4M, 12M, 32K and RC. The main purpose is to support different oscillator types and frequencies. MCU needs more current when operating at High-speed mode than the low-speed mode. For crystals, there are three steps to select. If the oscillator is RC type, to select "RC" and the system will divide the frequency by 2 automatically. User can select oscillator mode from code option table before compiling. Following is the code option table.

| Code Option	Oscillator Mode	Remark
00	RC mode	Output the Fcpu square wave from Xout pin.
01	32K	32768Hz
10	12M	12MHz ~ 16MHz
11	4M	3.58MHz

OSCILLATOR DEVIDE BY 2 CODE OPTION

SN8A1600 has a code option to divide external clock by 2,called "High_Clk / 2". If "High_Clk / 2" is enabled, the external clock frequency is divided by 8 for the Fcpu. Fcpu is equal to Fosc/8. If "High_Clk / 2" is disabled, the external clock frequency is divided by 4 for the Fcpu. The Fcpu is equal to Fosc/4.

➢   *Note: In RC mode, "High_Clk / 2" is always enabled.*

OSCILLATOR SAFE GUARD CODE OPTION

SN8A1600 builds in an oscillator safe guard (OSG) to make oscillator more stable. It is a low-pass filter circuit and stops high frequency noise into system from external oscillator circuit. This function makes system to work better under AC noisy conditions.

SYSTEM OSCILLATOR CIRCUITS
Crystal/Ceramic Oscillator
RC Oscillator
External clock input

- ➤ **Note1: The VDD and VSS of external oscillator circuit must be from micro-controller. Don't connect them from power terminal.**
- ➤ **Note2: The external clock input mode can select RC type oscillator or crystal type oscillator of the code option and input the external clock into XIN pin.**
- ➤ **Note3: In RC type oscillator code option situation, the external clock frequency is divided by 2.**
- ➤ **Note4: The power and ground of external oscillator circuit must be connected from the micro-controller's VDD and VSS. It is necessary to step up the performance of the whole system.**

External RC Oscillator Frequency Measurement

There are two ways to get the Fosc frequency of external RC oscillator. One measures the XOUT output waveform. Under external RC oscillator mode, the XOUT outputs the square waveform whose frequency is Fcpu. The other measures the external RC frequency by instruction cycle (Fcpu). The external RC frequency is the Fcpu multiplied by 4. We can get the Fosc frequency of external RC from the Fcpu frequency. The sub-routine to get Fcpu frequency of external oscillator is as the following.

➲ **Example: Fcpu instruction cycle of external oscillator**

```
        B0BSET    P1M.0           ; Set P1.0 to be output mode for outputting Fcpu toggle signal.

@@:
        B0BSET    P1.0            ; Output Fcpu toggle signal in low-speed clock mode.
        B0BCLR    P1.0            ; Measure the Fcpu frequency by oscilloscope.
        JMP       @B
```

INTERNAL LOW-SPEED OSCILLATOR

The internal low-speed oscillator is built in the micro-controller. The low-speed clock source is a RC type oscillator circuit. The low-speed clock can supplies clock for system clock and timer,.

● **Example: Stop internal low-speed oscillator.**

B0BSET	FCPUM0	; To stop external high-speed oscillator and internal low-speed
		; oscillator called power down mode (sleep mode).

➤ *Note: The internal low-speed clock can't be turned off individually. It is controlled by CPUM0 bit of OSCM register.*

The low-speed oscillator uses RC type oscillator circuit. The frequency is affected by the voltage and temperature of the system. In common condition, the frequency of the RC oscillator is about 16KHz at 3V and 32KHz at 5V. The relative between the RC frequency and voltage is as the following figure.
● **Example: Measure the internal RC frequency by instruction cycle (Fcpu). The internal RC frequency is the Fcpu multiplied by 4. We can get the Fosc frequency of internal RC from the Fcpu frequency.**

B0BSET	P1M.0	; Set P1.0 to be output mode for outputting Fcpu toggle signal.
B0BSET	FCLKMD	; Switch the system clock to internal low-speed clock mode.

@@:

B0BSET	P1.0	; Output Fcpu toggle signal in low-speed clock mode.
B0BCLR	P1.0	; Measure the Fcpu frequency by oscilloscope.
JMP	@B	

SYSTEM MODE DESCRIPTION

OVERVIEW

The chip is featured with low power consumption by switching around three different modes as following.

- ➢ High-speed mode
- ➢ Low-speed mode
- ➢ Power-down mode (Sleep mode)

In actual application, user can adjust the MCU to work in one of these four modes by using OSCM register. At the high-speed mode, the instruction cycle (Fcpu) is Fosc/4. At 3V, low-speed mode, the Fcpu is 16KHz/4.

NORMAL MODE

In normal mode, the system clock source is external high-speed clock. After power on, the system works under normal mode. The instruction cycle is fosc/4. When the external high-speed oscillator is 3.58MHz, the instruction cycle is 3.58MHz/4 = 895KHz. All software and hardware are executed and working. In normal mode, system can get into power down mode, slow mode and green mode.

SLOW MODE

In slow mode, the system clock source is external low-speed RC clock. To set CLKMD =1, the system switches into slow mode. In slow mode, the system works as normal mode but the slower clock. The system in slow mode can get into normal mode, power down mode, and green mode. To set STPHX = 1 to stop the external high-speed oscillator, and then the system consumes less power.

GREEN MODE (SN8A1602A Only)

The green mode is a less power consumption mode. Under green mode, there are only TC0 still counting and the other hardware stopping. The external high-speed oscillator or internal low-speed oscillator is operating. To set CPUM1 = 1 and CPUM0 = 0, the system gets into green mode. The system can be waked up to last system mode TC0 timer timeout and P0 trigger signal.

The green mode provides a time-variable wakeup function. Users can decide wakeup time by setting TC0 timer. There are two channels into green mode. One is normal mode and the other is slow mode. In normal mode, the TC0 timer overflow time is very short. In slow mode, the overflow time is longer. Users can select appropriate situation for their applications. Under green mode, the power consumption is 5u amp in 3V condition.

POWER DOWN MODE

The power down mode is also called sleep mode. The MCU stops working as sleeping status. The power consumption is very less as zero. The power down mode is usually applied to power-saving system like battery-powered productions. To set CUPM0 = 1, the system gets into power down mode. The external high-speed and low-speed oscillators are turned off. The system can be waked up by P0, P1 trigger signal.

SYSTEM MODE CONTROL
SN8A1600 Type.

SYSTEM MODE SWITCHING

Switch normal/slow mode to power down (sleep) mode.
CPUM0 = 1

B0BSET	FCPUM0	; Set CPUM0 = 1.

Switch normal mode to slow mode.

B0BSET	FCLKMD	;To set CLKMD = 1
B0BSET	FSTPHX	;To stop external high-speed oscillator.

➢ *Note: To stop high-speed oscillator is not necessary and user can omit it.*

Switch slow mode to normal mode (The external high-speed oscillator is still running)

B0BCLR	FCLKMD	;To set CLKMD = 0

Switch slow mode to normal mode (The external high-speed oscillator stops)
If external high clock stop and program want to switch back normal mode. It is necessary to delay at least 10mS for external clock stable.

	B0BCLR	FSTPHX	; Turn on the external high-speed oscillator.
	B0MOV	Z, #27	; If VDD = 5V, internal RC=32KHz (typical) will delay
@@:	DECMS	Z	; 0.125ms X 81 = 10.125ms for external clock stable
	JMP	@B	
			;
	B0BCLR	FCLKMD	; Change the system back to the normal mode

⮑ **Example: Go into Green mode and enable TC0 wakeup function.**

; Set TC0 timer wakeup functon.

B0BCLR	FTC0IEN	; To disable TC0 interrupt service
B0BCLR	FTC0ENB	; To disable TC0 timer
MOV	A,#20H	;
B0MOV	TC0M,A	; To set TC0 clock = fcpu / 64
MOV	A,#74H	
B0MOV	TC0C,A	; To set TC0C initial value = 74H (To set TC0 interval = 10 ms)
B0BCLR	FTC0IEN	; To disable TC0 interrupt service
B0BCLR	FTC0IRQ	; To clear TC0 interrupt request
B0BSET	FTC0ENB	; To enable TC0 timer
B0BSET	FTC0GN	; To enable TC0 wakeup function

; Go into green mode

B0BCLR	FCPUM0	;To set CPUMx = 10
B0BSET	FCPUM1	

➢ *Note: If TC0ENB = 0 or TC0GN = 0, TC0 is without wakeup from green mode to normal/slow mode function.*

WAKEUP TIME

OVERVIEW

The external high-speed oscillator needs a delay time from stopping to operating. The delay is very necessary and makes the oscillator work stably. The external high-speed oscillator sometimes starts and stops at different situations. The delay time for external high-speed oscillator restart is called wakeup time.

Following are two conditions need wakeup time. One is switching power down mode to normal mode. The other is switching slow mode to normal mode. For the first case, SN8A1600 provides 2048 oscillator clocks as the wakeup time. The second case, users need to calculate the wakeup time.

HARDWARE WAKEUP

When the system is in power down mode (sleep mode), the external high-speed oscillator stops. When waked up from power down mode, MCU waits for 2048 external high-speed oscillator clocks as the wakeup time to stable the oscillator circuit. After the wakeup time, the system goes into the normal mode. The value of the wakeup time is as the following.

$$The\ wakeup\ time = 1/Fosc * 2048\ (sec)$$

↻ **Example: In power down mode (sleep mode), the system is waked up by P0 or P1 trigger signal. After the wakeup time, the system goes into normal mode. The wakeup time of P0, P1 wakeup function is as the following.**

$$The\ wakeup\ time = 1/Fosc * 2048 = 0.57\ ms \qquad (Fosc = 3.58MHz)$$

$$The\ wakeup\ time = 1/Fosc * 2048 = 62.5\ ms \qquad (Fosc=32768Hz)$$

Under power down mode (sleep mode), there are only I/O ports with wakeup function wake the system up to normal mode. The Port 0 and Port 1 have wakeup function. Port 0 wakeup function always enables, but the Port 1 is controlled by the P1W register.

7 TIMERS

WATCHDOG TIMER (WDT)

The watchdog timer (WDT) is a binary up counter designed for monitoring program execution. If the program goes into the unknown status by noise interference, WDT overflow signal raises and resets MCU. The instruction that clear the watchdog timer (" B0BSET   FWDRST ") should be executed within a certain period. If an instruction that clears the watchdog timer is not executed within the period and the watchdog timer overflows, reset signal is generated and system is restarted. The watchdog timer rate has two rates for high/low speed mode. WDT rate selection is handled by oscillator code option. The watchdog timer disables at power down mode.

0CAH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
OSCM	0	WDRST	-	-	CPUM0	CLKMD	STPHX	-
Read/Write	-	R/W	-	-	R/W	R/W	R/W	-
After reset	-	0	-	-	0	0	0	-

WDRST: Watchdog timer reset bit. 0 = Non reset, 1 = clear the watchdog timer counter.

➢ *Note: The bit 7 must be "0", or the system will be error.*

Watchdog timer overflow table.

Watchdog timer rate	Watchdog timer overflow time
High speed	$1 / (fcpu \div 2^{14} \div 16) = 293$ ms, Fosc=3.58MHz
Low speed	$1 / (fcpu \div 2^{8} \div 16) = 4.5$ ms, Fosc=32768Hz

➢ *Note: The watchdog timer can be enabled or disabled by the code option.*

➲ **Example: An operation of watchdog timer is as following. To clear the watchdog timer counter in the top of the main routine of the program.**

Main:

```
        B0BSET      FWDRST          ; Clear the watchdog timer counter.
        .           .
        CALL        SUB1
        CALL        SUB2
        .           .
        .           .
        .           .
        JMP         MAIN
```

TIMER0 (TC0) (SN8A1602A Only)

OVERVIEW

The timer0 (TC0) is used to count system 'event' by identifying the transition (high-to-low) of incoming square wave signals. To indicate that an event has occurred, or that a specified time interval has elapsed, TC0 generates an interrupt request. By counting signal transition and comparing the current counter value with the reference register value, TC0 can be used to measure specific time intervals.
The main purposes of the TC0 timer is as following.

➢ **8-bit programmable timer:** Generates interrupts at specific time intervals based on the selected clock frequency.

TC0M MODE REGISTER

The TC0M is an 8-bit read/write timer mode register. By loading different value into the TC0M register, users can modify the timer clock frequency dynamically as program executing.

Eight rates for TC0 timer can be selected by TC0RATE0 ~ TC0RATE2 bits. The range is from fcpu/2 to fcpu/256. The TC0M initial value is zero and the rate is fcpu/256. The bit7 of TC0M called TC0ENB is the control bit to start TC0 timer. The combination of these bits is to determine the TC0 timer clock frequency and the intervals.

0DAH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC0M	TC0ENB	TC0rate2	TC0rate1	TC0rate0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	-	-	-	-
After reset	0	0	0	0	-	-	-	-

TC0ENB: TC0 counter enable bit. "0" = disable, "1" = enable.
TC0RATE2~TC0RATE0: TC0 internal clock select bits. 000 = fcpu/256, 001 = fcpu/128, … , 110 = fcpu/4, 111 = fcpu/2.

TC0C COUNTING REGISTER

TC0C is an 8-bit counter register for the timer (TC0). TC0C must be reset whenever the TC0ENB is set to "1" to start the timer. TC0C is incremented each time a clock pulse of the frequency determined by TC0RATE0 ~ TC0RATE2. When TC0C has incremented to "0FFH", it counts to "00H" an overflow generated. Under TC0 interrupt service request (TC0IEN) enable condition, the TC0 interrupt request flag will be set to "1" and the system executes the interrupt service routine. The TC0C has no auto reload function. After TC0C overflow, the TC0C is continuing counting. Users need to reset TC0C value to get an accurate time.

0DBH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC0C	TC0C7	TC0C6	TC0C5	TC0C4	TC0C3	TC0C2	TC0C1	TC0C0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

The basic timer table interval time of TC0.

TC0RATE	TC0CLOCK	High speed mode (fcpu = 3.58MHz / 4)		Low speed mode (fcpu = 32768Hz / 4)	
		Max overflow interval	One step = max/256	Max overflow interval	One step = max/256
000	fcpu/256	73.2 ms	286us	8000 ms	31.25 ms
001	fcpu/128	36.6 ms	143us	4000 ms	15.63 ms
010	fcpu/64	18.3 ms	71.5us	2000 ms	7.8 ms
011	fcpu/32	9.15 ms	35.8us	1000 ms	3.9 ms
100	fcpu/16	4.57 ms	17.9us	500 ms	1.95 ms
101	fcpu/8	2.28 ms	8.94us	250 ms	0.98 ms
110	fcpu/4	1.14 ms	4.47us	125 ms	0.49 ms
111	fcpu/2	0.57 ms	2.23us	62.5 ms	0.24 ms

The equation of TC0C initial value is as following.

> *TC0C initial value = 256 - (TC0 interrupt interval time * input clock)*

⟳ **Example: To set 10ms interval time for TC0 interrupt at 3.58MHz high-speed mode. TC0C value (74H) = 256 - (10ms * fcpu/64)**

> *TC0C initial value = 256 - (TC0 interrupt interval time * input clock)*
> $$= 256 - (10ms * 3.58 * 10^6 / 4 / 64)$$
> $$= 256 - (10^{-2} * 3.58 * 10^6 / 4 / 64)$$
> $$= 116$$
> $$= 74H$$

TC0 TIMER OPERATION SEQUENCE

The TC0 timer's sequence of operation may be as following.

- ➢ Set the TC0C initial value to setup the interval time.
- ➢ Set the TC0ENB to be "1" to enable TC0 timer.
- ➢ TC0C is incremented by one after each clock pulse corresponding to TC0M selection.
- ➢ TC0C overflow if TC0C from FFH to 00H.
- ➢ When TC0C overflow occur, the TC0IRQ flag is set to be "1" by hardware.
- ➢ Execute the interrupt service routine.
- ➢ Users reset the TC0C value and resume the TC0 timer operation.

➲ **Example: Setup the TC0M and TC0C.**

```
            B0BCLR      FTC0IEN         ; To disable TC0 interrupt service
            B0BCLR      FTC0ENB         ; To disable TC0 timer
            MOV         A,#20H          ;
            B0MOV       TC0M,A          ; To set TC0 clock = fcpu / 64
            MOV         A,#74H          ; To set TC0C initial value = 74H
            B0MOV       TC0C,A          ;(To set TC0 interval = 10 ms)

            B0BSET      FTC0IEN         ; To enable TC0 interrupt service
            B0BCLR      FTC0IRQ         ; To clear TC0 interrupt request
            B0BSET      FTC0ENB         ; To enable TC0 timer
```

➲ **Example: TC0 interrupt service routine.**

```
            ORG         8               ; Interrupt vector
            JMP         INT_SERVICE
INT_SERVICE:

            B0XCH       A, ACCBUF       ; B0xch instruction do not change C,Z flag
            B0MOV       A, PFLAG
            B0MOV       PFLAGBUF, A

            B0BTS1      FTC0IRQ         ; Check TC0IRQ
            JMP         EXIT_INT        ; TC0IRQ = 0, exit interrupt vector

            B0BCLR      FTC0IRQ         ; Reset TC0IRQ
            MOV         A,#74H          ; Reload TC0C
            B0MOV       TC0C,A
            .           .               ; TC0 interrupt service routine
            .           .
            JMP         EXIT_INT        ; End of TC0 interrupt service routine and exit interrupt
                                          vector
            .           .
            .           .
EXIT_INT:
            B0MOV       A, PFLAGBUF
            B0MOV       PFLAG, A
            B0XCH       A, ACCBUF       ; Restore ACC value.

            RETI                        ; Exit interrupt vector
```

TIMER1 (TC1) (SN8A1604A Only)

OVERVIEW

The timer 1(TC1) is used to count system 'event' by identifying the transition (high-to-low) of incoming square wave signals. To indicate that an event has occurred, or that a specified time interval has elapsed, TC1 generates an interrupt request. By counting signal transition and comparing the current counter value with the reference register value, TC1 can be used to measure specific time intervals.
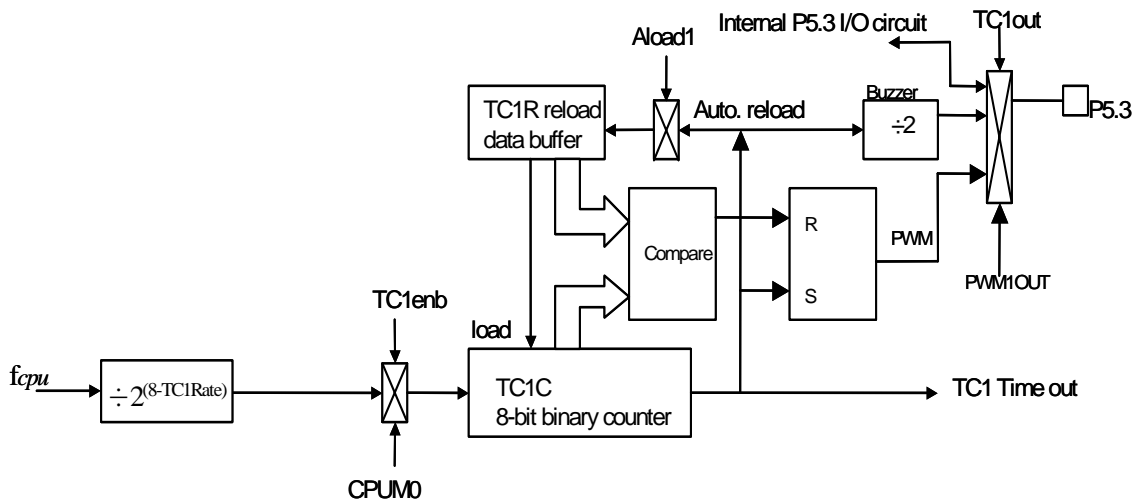

The main purposes of the TC1 timer is as following.

➢ **8-bit programmable timer:** Generates interrupts at specific time intervals based on the selected clock frequency.

TC1M MODE REGISTER

The TC1M is an 8-bit read/write timer mode register. By loading different value into the TC1M register, users can modify the timer clock frequency dynamically as program executing.

Eight rates for TC1 timer can be selected by TC0RATE1 ~ TC1RATE2 bits. The range is from fcpu/2 to fcpu/256. The TC1M initial value is zero and the rate is fcpu/256. The bit7 of TC1M called TC1ENB is the control bit to start TC1 timer. The combination of these bits is to determine the TC1 timer clock frequency and the intervals.

0DCH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC1M	TC1ENB	TC1rate2	TC1rate1	TC1rate0	0	ALOAD1	TC1OUT	PWM1OUT
Read/Write	R/W	R/W	R/W	R/W	-	R/W	R/W	R/W
After reset	0	0	0	0	-	0	0	0

TC1ENB: TC1 counter/BZ1/PWM1OUT enable bit. "0" = disable, "1" = enable.
TC1RATE2~TC1RATE0: TC1 internal clock select bits. 000 = fcpu/256, 001 = fcpu/128, … , 110 = fcpu/4, 111 = fcpu/2.
ALOAD1: TC1 auto-reload control bit, "0" the auto-reload function is disabled. "1 " is to enable the auto-reload function.
TC1OUT : TC1 Time-out toggle signal output control bit. "0": No TC1 time-out output signal. "1": When TC1 time-out occurs, P5.3 output toggles.
PWM1OUT : PWM output control bit. "0": No PWM output function. "1": PWM will output waveform through pin P5.3.

TC1C COUNTING REGISTER

TC1C is an 8-bit counter register for the timer (TC1). TC1C must be reset whenever the TC1ENB is set to "1" to start the timer. TC1C is incremented each time a clock pulse of the frequency determined by TC1RATE0 ~ TC1RATE2. When TC1C has incremented to "0FFH", it counts to "00H" an overflow generated. Under TC1 interrupt service request (TC1IEN) enable condition, the TC1 interrupt request flag will be set to "1" and the system executes the interrupt service routine. When TC1C overflows, the TC1C will be restored if ALOAD1 is enabled.

0DDH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC1C	TC1C7	TC1C6	TC1C5	TC1C4	TC1C3	TC1C2	TC1C1	TC1C0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	-	-	-	-	-	-	-	-

The basic timer table interval time of TC1.

TC1RATE	TC1CLOCK	High speed mode (fcpu = 3.58MHz / 4)		Low speed mode (fcpu = 32768Hz / 4)	
		Max overflow interval	One step = max/256	Max overflow interval	One step = max/256
000	fcpu/256	73.2 ms	286us	8000 ms	31.25 ms
001	fcpu/128	36.6 ms	143us	4000 ms	15.63 ms
010	fcpu/64	18.3 ms	71.5us	2000 ms	7.8 ms
011	fcpu/32	9.15 ms	35.8us	1000 ms	3.9 ms
100	fcpu/16	4.57 ms	17.9us	500 ms	1.95 ms
101	fcpu/8	2.28 ms	8.94us	250 ms	0.98 ms
110	fcpu/4	1.14 ms	4.47us	125 ms	0.49 ms
111	fcpu/2	0.57 ms	2.23us	62.5 ms	0.24 ms

The equation of TC1C initial value is as following.

> *TC1C initial value = 256 - (TC1 interrupt interval time * input clock)*

↻ **Example: To set 10ms interval time for TC1 interrupt at 3.58MHz high-speed mode. TC1C value (74H) = 256 - (10ms * fcpu/64)**

$$TC1C\ initial\ value = 256 - (TC1\ interrupt\ interval\ time * input\ clock)$$
$$= 256 - (10ms * 3.58 * 10^6 / 4 / 64)$$
$$= 256 - (10^{-2} * 3.58 * 10^6 / 4 / 64)$$
$$= 116$$
$$= 74H$$

TC1R AUTO-LOAD REGISTER

TC1R is an 8-bit register for the TC1 auto-reload function. TC1R's value applies to TC1OUT and PWM1OUT functions. The TC1R operation needs to enable TC1 auto-load function (ALOAD1=1). Under TC1OUT and PWM1OUT applications, users must enable and set the TC1R register. The main purpose of TC1R is as following.

➢ Store the auto-reload value and set into TC1C when the TC1C overflow. (ALOAD1 = 1).
➢ Store the duty value of PWM1OUT function.

0DEH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC1R	TC1R7	TC1R6	TC1R5	TC1R4	TC1R3	TC1R2	TC1R1	TC1R0
Read/Write	W	W	W	W	W	W	W	W
After reset	-	-	-	-	-	-	-	-

The equation of TC1R initial value is like TC1C as following.

$$\boxed{\textit{TC1R initial value = 256 - (TC1 interrupt interval time * input clock)}}$$

➢ **Note: The TC1R is write-only register can't be process by INCMS, DECMS instructions.**

TC1 TIMER COUNTER OPERATION SEQUENCE

The TC1 timer's sequence of operation can be following.

- ➤ Set the TC1C initial value to setup the interval time.
- ➤ Set the TC1ENB to be "1" to enable TC1 timer counter.
- ➤ TC1C is incremented by one with each clock pulse which frequency is corresponding to TC1M selection.
- ➤ TC1C overflow if TC1C from FFH to 00H.
- ➤ When TC1C overflow occur, the TC1IRQ flag is set to be "1" by hardware.
- ➤ Execute the interrupt service routine.
- ➤ Users reset the TC1C value and resume the TC1 timer operation.

➲ **Example: Setup the TC1M and TC1C without auto-reload function.**

```
            B0BCLR      FTC1IEN          ; To disable TC1 interrupt service
            B0BCLR      FTC1ENB          ; To disable TC1 timer
            MOV         A,#20H           ;
            B0MOV       TC1M,A           ; To set TC1 clock = fcpu / 64
            MOV         A,#74H           ; To set TC1C initial value = 74H
            B0MOV       TC1C,A           ;(To set TC1 interval = 10 ms)

            B0BSET      FTC1IEN          ; To enable TC1 interrupt service
            B0BCLR      FTC1IRQ          ; To clear TC1 interrupt request
            B0BSET      FTC1ENB          ; To enable TC1 timer
```

➲ **Example: Setup the TC1M and TC1C with auto-reload function.**

```
            B0BCLR      FTC1IEN          ; To disable TC1 interrupt service
            B0BCLR      FTC1ENB          ; To disable TC1 timer
            MOV         A,#20H           ;
            B0MOV       TC1M,A           ; To set TC1 clock = fcpu / 64
            MOV         A,#74H           ; To set TC1C initial value = 74H
            B0MOV       TC1C,A           ; (To set TC1 interval = 10 ms)
            B0MOV       TC1R,A           ; To set TC1R auto-reload register

            B0BSET      FTC1IEN          ; To enable TC1 interrupt service
            B0BCLR      FTC1IRQ          ; To clear TC1 interrupt request
            B0BSET      FTC1ENB          ; To enable TC1 timer
            B0BSET      ALOAD1           ; To enable TC1 auto-reload function.
```

➲ **Example: TC1 interrupt service routine without auto-reload function.**

```
                ORG         8                   ; Interrupt vector
                JMP         INT_SERVICE
INT_SERVICE:

                B0XCH       A, ACCBUF           ; B0XCH doesn't change C, Z flag
                B0MOV       A, PFLAG
                B0MOV       PFLAGBUF, A         ; Save PFLAG register in a buffer

                B0BTS1      FTC1IRQ             ; Check TC1IRQ
                JMP         EXIT_INT            ; TC1IRQ = 0, exit interrupt vector

                B0BCLR      FTC1IRQ             ; Reset TC1IRQ
                MOV         A,#74H              ; Reload TC1C
                B0MOV       TC1C,A
                .           .                   ; TC1 interrupt service routine
                .           .

TC1 CLOCK FREQUENCY OUTPUT (BUZZER)

TC1 timer counter provides a frequency output function. By setting the TC1 clock frequency, the clock signal is output to P5.3 and the P5.3 general purpose I/O function is auto-disable. The TC1 output signal divides by 2. The TC1 clock has many combinations and easily to make difference frequency. This function applies as buzzer output to output multi-frequency.

TC1 Clock

TC1OUT Pulse

Figure 7-1. The TC1OUT Pulse Frequency

➲ **Example: Setup TC1OUT output from TC1 to TC1OUT (P5.3). The external high-speed clock is 4MHz. The TC1OUT frequency is 1KHz. Because the TC1OUT signal is divided by 2, set the TC1 clock to 2KHz. The TC1 clock source is from external oscillator clock. TC1 rate is Fcpu/4. The TC1RATE2~TC1RATE1 = 110. TC1C = TC1R = 131.**

```
        MOV         A,#01100000B
        B0MOV       TC1M,A              ; Set the TC1 rate to Fcpu/4

        MOV         A,#131              ; Set the auto-reload reference value
        B0MOV       TC1C,A
        B0MOV       TC1R,A

        B0BSET      FTC1OUT             ; Enable TC1 output to P5.3 and disable P5.3 I/O function
        B0BSET      FALOAD1             ; Enable TC1 auto-reload function
        B0BSET      FTC1ENB             ; Enable TC1 timer
```

# PWM FUNCTION DESCRIPTION (SN8P1604 Only)

OVERVIEW

PWM function is generated by TC1 timer counter and output the PWM signal to PWM1OUT pin (P5.3). The 8-bit counter counts modulus 256, from 0-255, inclusive. The value of the 8-bit counter is compared to the contents of the reference register TC1R. When the reference register value TC1R is equal to the counter value TC1C, the PWM output goes low. When the counter reaches zero, the PWM output is forced high. The low-to-high ratio (duty) of the PWM1 output is TC1R/256.

All PWM outputs remain inactive during the first 256 input clock signals. Then, when the counter value (TC1C) changes from FFH back to 00H, the PWM output is forced to high level. The pulse width ratio (duty cycle) is defined by the contents of the reference register (TC1R) and is programmed in increments of 1:256. The 8-bit PWM data register TC1R is a write only register.

PWM output can be held at low level by continuously loading the reference register with 00H. Under PWM operating, to change the PWM's duty cycle is to modify the TC1R.

Reference Register Value (TC1R)	Duty
0000 0000	0/256
0000 0001	1/256
0000 0010	2/256
.	.
.	.
1000 0000	128/256
1000 0001	129/256
.	.
.	.
1111 1110	254/256
1111 1111	255/256
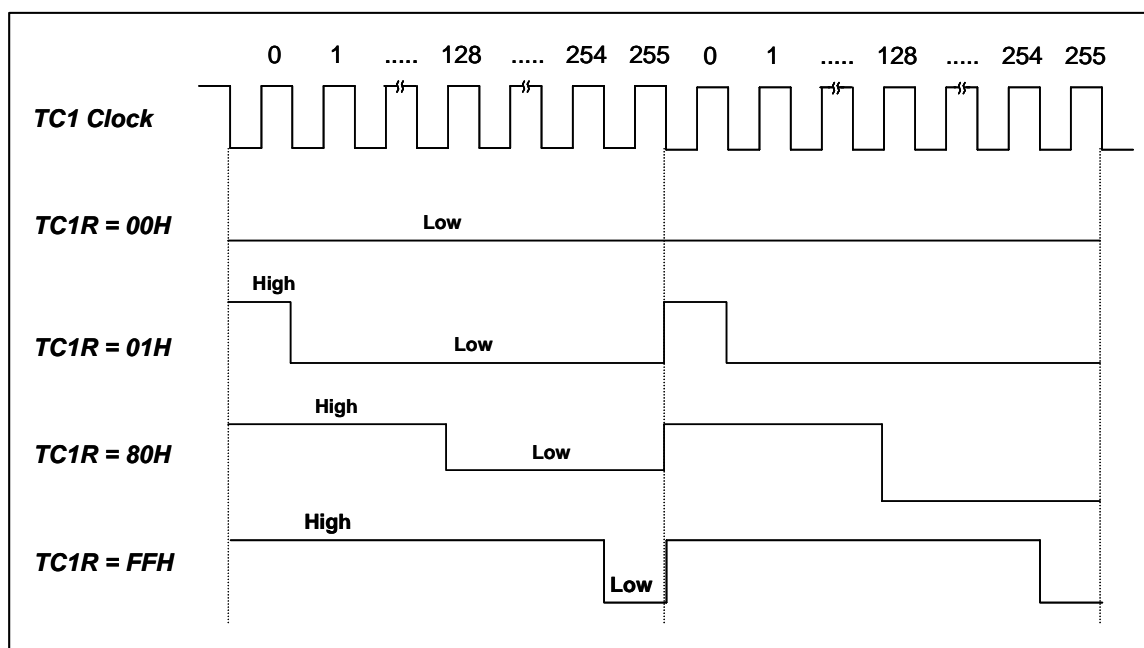

PWM PROGRAM DESCRIPTION

⮞ **Example: Setup PWM1 output from TC1 to PWM1OUT (P5.3). The external high-speed oscillator clock is 4MHz. The duty of PWM is 30/256. The PWM frequency is about 1KHz. The PWM clock source is from external oscillator clock. TC1 rate is Fcpu/4. The TC1RATE2~TC1RATE1 = 110. TC1C = TC1R = 30.**

```
        MOV         A,#01100000B
        B0MOV       TC1M,A              ; Set the TC1 rate to Fcpu/4

        MOV         A,#30               ; Set the PWM duty to 30/256
        B0MOV       TC1C,A
        B0MOV       TC1R,A

        B0BCLR      FTC1OUT             ; Disable TC1OUT function.
        B0BSET      FALOAD1             ; Enable TC1 auto-reload function
        B0BSET      FPWM1OUT            ; Enable PWM1 output to P5.3 and disable P5.3 I/O function
        B0BSET      FTC1ENB             ; Enable TC1 timer
```

➢ *Note1: The TC1R is write-only register. Don't process them using INCMS, DECMS instructions.*

⮞ **Example: Modify TC1R registers' value.**

```
        MOV         A, #30H             ; Input a number using B0MOV instruction.
        B0MOV       TC1R, A

        INCMS       BUF1                ; Get the new TC1R value from the BUF1 buffer defined by
        B0MOV       A, BUF1             ; programming.
        B0MOV       TC1R, A
```
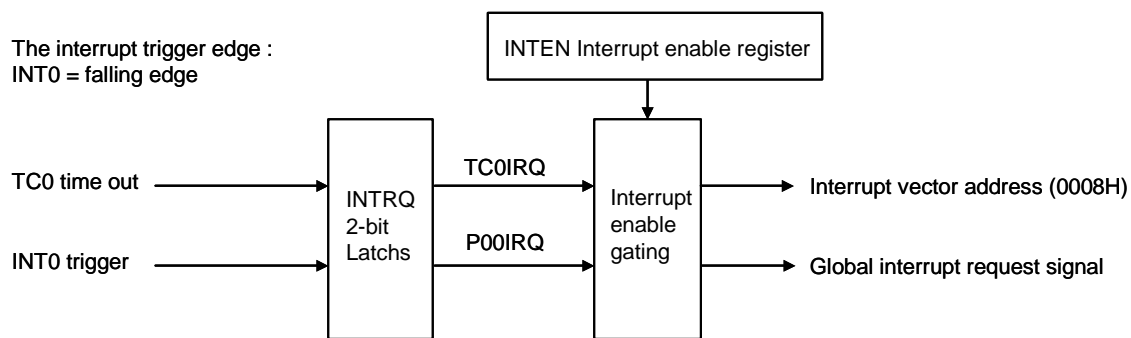

➢ *Note2: That is better to set the TC1C and TC1R value together when PWM1 duty modified. It protects the PWM1 signal no glitch as PWM1 duty changing.*

➢ *Note3: The TC1OUT function must be set "0" when PWM1 output enable.*

➢ *Note4: The PWM can work with interrupt request.*

8 INTERRUPT

OVERVIEW

The SN8A1600 provides 2 interrupt sources, including one internal interrupts (TC0/TC1) and one external interrupts (INT0). The external interrupt can wakeup the chip while the system is switched from power down mode to high-speed normal mode. Once interrupt service is executed, the GIE bit in STKP register will clear to "0" for stopping other interrupt request. On the contrast, when interrupt service exits, the GIE bit will set to "1" to accept the next interrupts' request. All of the interrupt request signals are stored in INTRQ register. The user can program the chip to check INTRQ's content for setting executive priority.

INTEN Interrupt enable register

TC1 time out ────→ INTRQ 2-bit Latches ──TC1IRQ──→ Interrupt enable gating ──→ Interrupt vector address (0008H)

INT0 trigger ────→ ──P00IRQ──→ ──→ Global interrupt request signal

➢ ***Note: The GIE bit must enable and all interrupt operations work.***

INTEN INTERRUPT ENABLE REGISTER

INTEN is the interrupt request control register including one internal interrupts, one external interrupts enable control bits. One of the register to be set "1" is to enable the interrupt request function. Once of the interrupt occur, the stack is incremented and program jump to ORG 8 to execute interrupt service routines. The program exits the interrupt service routine when the returning interrupt service routine instruction (RETI) is executed.

➢ **SN8A1602A**

0C9H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
INTEN	0	0	TC0IEN	0	0	0	0	P00IEN

0C9H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
INTEN	0	TC1IEN	0	0	0	0	0	P00IEN
Read/Write	-	R/W	-	-	-	-	-	R/W
After reset	-	0	-	-	-	-	-	0

P00IEN : External P0.0 interrupt control bit. 0 = disable, 1 = enable.
TC0IEN : Timer 0 interrupt control bit. 0 = disable, 1 = enable.

INTRQ INTERRUPT REQUEST REGISTER

INTRQ is the interrupt request flag register. The register includes all interrupt request indication flags. Each one of the interrupt requests occurs, the bit of the INTRQ register would be set "1". The INTRQ value needs to be clear by programming after detecting the flag. In the interrupt vector of program, users know the any interrupt requests occurring by the register and do the routine corresponding of the interrupt request.

➢ **SN8A1602A**

0C8H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

After reset	-	0	-	-	-	-	-	0

P00IRQ : External P0.0 interrupt request bit. 0 = non-request, 1 = request.
TC0IRQ : TC0 timer interrupt request controls bit. 0 = non request, 1 = request.

INTERRUPT OPERATION DESCRIPTION

SN8A1600 provides 2 interrupts. Each operation of the 2 interrupts is as following.

GIE GLOBAL INTERRUPT OPERATION

GIE is the global interrupt control bit. All interrupts start work after the GIE = 1. It is necessary for interrupt service request. One of the interrupt requests occurs, and the program counter (PC) points to the interrupt vector (ORG 8) and the stack add 1 level.

0DFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
STKP	GIE	-	-	-	-	STKPB2	STKPB1	STKPB0
Read/Write	R/W	-	-	-	-	R/W	R/W	R/W
After reset	0	-	-	-	-	1	1	1

GIE: Global interrupt control bit. 0 = disable, 1 = enable.

➲   **Example: Set global interrupt control bit (GIE).**

          B0BSET   FGIE   ; Enable GIE

➢   *Note: The GIE bit must enable and all interrupt operations work.*

INT0 (P0.0) INTERRUPT OPERATION

The INT0 has falling edge interrupt trigger. For SN8A1600, the INT0 just uses the falling edge to trigger the external interrupt 0. There is a table to show the external interrupt 0 (INT0) operations.

Chip	Trigger Direction	Description
SN8A1602A	Falling edge	Interrupt trigger.
SN8A1604A	Falling edge	Interrupt trigger.

When the INT0 trigger occurs, the P00IRQ will be set to "1" however the P00IEN is enable or disable. If the P00IEN = 1, the trigger event sets the P00IRQ to be "1" and the system into interrupt vector (ORG 8). If the P00IEN = 0, the trigger event just only sets the P00IRQ to be "1" but the system doesn't get into interrupt vector. Users need to care the operation under multi-interrupt situation.

➲ **Example: INT0 interrupt request setup.**

```
        B0BSET      FP00IEN                 ; Enable INT0 interrupt service
        B0BCLR      FP00IRQ                 ; Clear INT0 interrupt request flag
        B0BSET      FGIE                    ; Enable GIE
```

➲ **Example: INT0 interrupt service routine.**

```
            ORG         8                   ; Interrupt vector
            JMP         INT_SERVICE
INT_SERVICE:

            B0XCH       A, ACCBUF           ; Store ACC value.
            B0MOV       A, PFLAG
            B0MOV       PFLAGBUF, A

            B0BTS1      FP00IRQ             ; Check P00IRQ
            JMP         EXIT_INT            ; P00IRQ = 0, exit interrupt vector

            B0BCLR      FP00IRQ             ; Reset P00IRQ
            .           .                   ; INT0 interrupt service routine
            .           .
EXIT_INT:
            B0MOV       A, PFLAGBUF
            B0MOV       PFLAG, A
            B0XCH       A, ACCBUF           ; Restore ACC value.

            RETI                            ; Exit interrupt vector
```

TC0/TC1 INTERRUPT OPERATION

When the TC0C/TC1C counter occurs overflow, the TC0IRQ/TC1IRQ will be set to "1" however the TC0IEN/TC1IEN is enable or disable. If the TC0IEN = 1, the trigger event sets the TC0IRQ/TC1IRQ to be "1" and the system into interrupt 0vector. If the TC0IEN/TC1IEN = 0, the trigger event will make the TC0IRQ/TC1IEN to be "1" but the system not into interrupt vector. Users need to care the operation under multi-interrupt situation.

➲ **Example: TC0 interrupt request setup.**

```
                B0BCLR      FTC0IEN         ; Disable TC0 interrupt service
                B0BCLR      FTC0ENB         ; Disable TC0 timer
                MOV         A, #20H         ;
                B0MOV       TC0M, A         ; Set TC0 clock = Fcpu / 64
                MOV         A, #74H         ; Set TC0C initial value = 74H
                B0MOV       TC0C, A         ; Set TC0 interval = 10 ms

                B0BSET      FTC0IEN         ; Enable TC0 interrupt service
                B0BCLR      FTC0IRQ         ; Clear TC0 interrupt request flag
                B0BSET      FTC0ENB         ; Enable TC0 timer

                B0BSET      FGIE            ; Enable GIE
```

➲ **Example: TC0 interrupt service routine.**

```
                ORG         8               ; Interrupt vector
                JMP         INT_SERVICE
INT_SERVICE:

                B0XCH       A, ACCBUF       ; Store ACC value.
                B0MOV       A, PFLAG
                B0MOV       PFLAGBUF, A

                B0BTS1      FTC0IRQ         ; Check TC0IRQ
                JMP         EXIT_INT        ; TC0IRQ = 0, exit interrupt vector

                B0BCLR      FTC0IRQ         ; Reset TC0IRQ
                MOV         A, #74H
                B0MOV       TC0C, A         ; Reset TC0C.
                .           .               ; TC0 interrupt service routine
                .           .
EXIT_INT:
                B0MOV       A, PFLAGBUF
                B0MOV       PFLAG, A
                B0XCH       A, ACCBUF       ; Restore ACC value.

                RETI                        ; Exit interrupt vector
```

MULTI-INTERRUPT OPERATION

In almost conditions, the software designer uses more than one interrupt requests. Processing multi-interrupt request needs to set the priority of these interrupt requests. The IRQ flags of interrupts are controlled by the interrupt event. But the IRQ flag "1" doesn't mean the system to execute the interrupt vector. The IRQ flags can be set "1" by the events without interrupt enable. Just only any the event occurs and the IRQ will be logic "1". The IRQ and its trigger event relationship is as the below table.

Interrupt Name	Trigger Event Description
P00IRQ	P0.0 trigger. OTP is falling edge.
TC0IRQ	TC0C overflow. (SN8A1602A)
TC1IRQ	TC1C overflow. (SN8A1604A)

There are two works need to do for multi-interrupt conditions. One is to make a good priority for these interrupt requests. Two is using IEN and IRQ flags to decide executing interrupt service routine or not. Users have to check interrupt control bit and interrupt request flag in interrupt vector. There is a simple routine as following.

➲ **Example: How do users check the interrupt request in multi-interrupt situation?**

```
            ORG         8                   ; Interrupt vector

            B0XCH       A, ACCBUF           ; Store ACC value.
            B0MOV       A, PFLAG            ; Store PFLAG value
            B0MOV       PFLAGBUF,A

INTP00CHK:                                  ; Check INT0 interrupt request
            B0BTS1      FP00IEN             ; Check P00IEN
            JMP         INTTC0CHK           ; Jump check to next interrupt
            B0BTS0      FP00IRQ             ; Check P00IRQ
            JMP         INTP00              ; Jump to INT0 interrupt service routine
INTTC0CHK:                                  ; Check TC0 interrupt request
            B0BTS1      FTC0IEN             ; Check TC0IEN
            JMP         INT_EXIT            ; Jump to exit of IRQ
            B0BTS0      FTC0IRQ             ; Check TC0IRQ
            JMP         INTTC0              ; Jump to TC0 interrupt service routine
INT_EXIT:

            B0MOV       A, PFLAGBUF         ; Restore PFLAG value
            B0MOV       PFLAG,A
            B0XCH       A, ACCBUF           ; Restore ACC value.

            RETI                            ; Exit interrupt vector
```
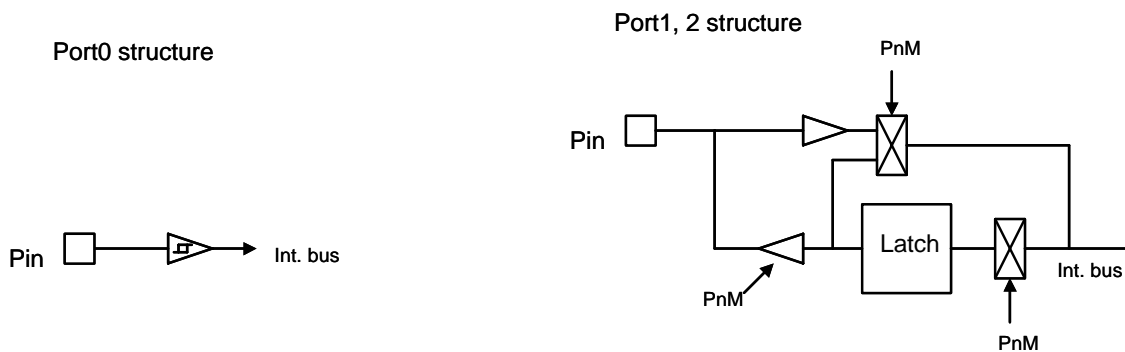

9 I/O PORT

OVERVIEW

The SN8A1602A provides up to 3 ports for users' application, consisting of one input only port (P0), two I/O ports (P1, P2,). The SN8A1602A is without input pull-up resistors. The direction of I/O port is selected by PnM register. After the system resets, these ports work as input function.

The SN8A1604A provides 4 ports for users' application, consisting of one input port (P0) and three I/O ports (P1,P2,P5). The direction of I/O port is selected by PnM register. After the system resets, these ports work as input port without pull up resistors. If the user want to read-in a signal from I/O pin, it recommends to switch I/O pin as input mode to execute read-in instruction. (B0BTS0 M.b, B0BTS1 M.b or B0MOV A,M). The pull-up resistor can be set up by the code option in the programming phase.

P1.0~P1.4	I/O	General-purpose input/output function	
		Wakeup for power down mode	Low level
P2.0~P2.7	I/O	General-purpose input/output function	

➢ *Note: The P1.4 enables when the external oscillator is RC type.*

➢ **SN8A1604A**

Port/Pin	I/O	Function Description	Remark
P0.0	I	General-purpose input function	
		External interrupt (INT0)	See <P00G1,P00G0>
		Wakeup for power down mode	Low level
P0.1	I	Wakeup for power down mode	Low level
P1.0~P1.7	I/O	General-purpose input/output function	
		Wakeup for power down mode	Low level
P2.0~P2.7	I/O	General-purpose input/output function	
P5.0~P5.3	I/O	General-purpose input/output function	

I/O PORT MODE

The port direction is programmed by PnM register. Port 0 is always input mode. Port 1 and Port 2 can select input or output direction. The each bit of PnM is set to "0", the I/O pin is input mode. The each bit of PnM is set to "1", the I/O pin is output mode.

B0BTS0       P1.2           ; Bit test 0 for P1.2
```

# **10**PCB LAYOUT NOTICE

POWER CIRCUIT

The right placement of bypass capacitors in single VDD case
The micro-controller's power must be very clean and stable, otherwise the MCU operation could be affected by noise through power plane. Connect appropriate bypass capacitors between VDD and VSS can reform noise influence and get a better power source. In general speaking, a 0.1uF and a 1u to 47uF bypass capacitor are necessary. The purpose of 0.1uF capacitor is to bypass high frequency noise and the 1u to 47uF capacitor is to provide a stable power tank. The distance between bypass capacitors and power pin of MCU should be as close as possible. It's useless to just put the bypass capacitors on power supply side and far away the VDD pin of MCU.

The right placement of bypass capacitors in multiple VDD case
The micro-controller's power must be very clean and stable or easy affected by noise through power plane. To add the bypass capacitor between VDD and VSS can reform noisy effecting and get a better power source. In normal condition, the bypass capacitors are 0.1uF and 1u ~47uF. The 0.1uF capacitor is necessary and the 1u ~47uF capacitor is set better. The bypass capacitors should been approached to the micro-controller's power pins as closely as possible. Don't set the bypass capacitors on power source terminal directly. That is useless.

Some SONIX micro-controllers have multi-power pins. These micro-controllers have more than one VDD and VSS. For external circuit application, VDDs should been connected together like one VDD dot and the VSSs also should been connected together like a VSS dot. The center of VDDs or VSSs must be very closely to the micro-controller. The bypass capacitors are set between the VDD center and VSS center.

GENERAL PCB POWER LAYOUT
Under circuit working condition, there are transient current, voltage or external noise through the power line and make the power not stable. The power changing may let the system operating error or fail. To separate the PCB to different area is a good solution and work. In above the diagram, the power and ground are together and have the same direction. The PCB board separates to three areas. There is one power source into the PCB and separate three channels into each area. One area just only looks like within a single power. This way can get a good and unique power of each area.

EXTERNAL OSCILLATOR CIRCUIT

Crystal/Ceramic Resonator Oscillator Circuit
Using Crystal/Ceramic resonator to generate the external clock needs to connect two 20pF bypass capacitor from XIN and XOUT pin of micro-controller to VSS. The two terminals of crystal/ceramic resonator connect to XIN and XOUT pin of micro-controller. The VSS of the bypass capacitor must been connected to the VSS pin of micro-controller first. It is necessary to get a stable oscillator output. Don't connect the VSS of the bypass capacitor to the power source individually. That makes the oscillator to been affected by the power ground easily. The external oscillator circuit must approach to the micro-controller as closely as possible.

RC Type Oscillator Circuit
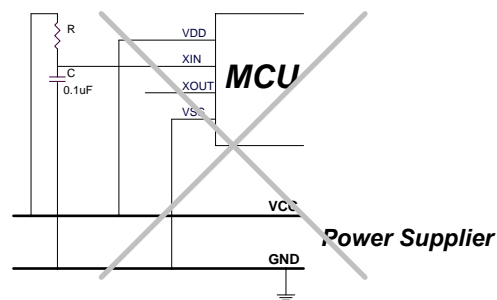

Using RC oscillator to generate the external clock needs to connect one 0.1uF bypass capacitor from XIN of micro-controller to VSS. The VSS of the bypass capacitor must been connected to the VSS pin of micro-controller first. It is necessary to get a stable oscillator output. Don't connect the VSS of the bypass capacitor to the power source individually. That makes the oscillator to been affected by the power ground easily. The external oscillator circuit must approach to the micro-controller as closely as possible.

EXTERNAL RESET CIRCUIT

## SN8A17xx Series OTP Micro-controller
The external reset circuit is a simple RC circuit. The resistor is set between VDD and RST pin of the micro-controller. The bypass capacitance is between RST pin and VSS of the micro-controller. The VDD and VSS of the reset circuit must been connected to the VDD and VSS pins of the micro-controller. It makes the reset status more stable. Don't connect the VDD and VSS of the reset circuit to the power source individually. The external reset circuit must approach to the micro-controller as closely as possible.

SN8A1600 Series OTP Micro-controller and All Series MASK Micro-controller
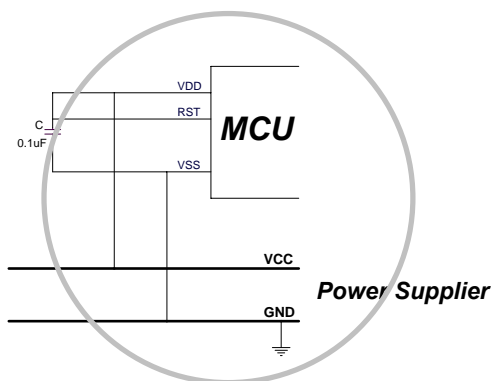

For SONIX 1600 series micro-controller, the external reset circuit is just only a bypass capacitor. The VDD is into RST pin of the micro-controller directly. The bypass capacitance is between RST pin and VSS of the micro-controller. The VDD and VSS of the reset circuit must been connected to the VDD and VSS pins of the micro-controller. It makes the reset status more stable. Don't connect the VDD and VSS of the reset circuit to the power source individually. The external reset circuit must approach to the micro-controller as closely as possible.

11 CODE OPTION TABLE

SN8A1602A

Code Option	Content	Function Description
High_Clk	RC	Low cost RC for external high clock oscillator
	32K X'tal	Low frequency, power saving crystal (e.g. 32.768K) for external high clock oscillator
	12M X'tal	High speed crystal /resonator (e.g. 12M) for external high clock oscillator
	4M X'tal	Standard crystal /resonator (e.g. 3.58M) for external high clock oscillator
High_Clk / 2	Enable	External high clock divided by two, Fosc = high clock / 2
	Disable	Fosc = high clock
OSG	Enable	Enable Oscillator Safe Guard function
	Disable	Disable Oscillator Safe Guard function
Watch_Dog	Enable	Enable Watch Dog function
	Disable	Disable Watch Dog function

SN8P1604

Code Option	Content	Function Description
High_Clk	RC	Low cost RC for external high clock oscillator
	32K X'tal	Low frequency, power saving crystal (e.g. 32.768K) for external high clock oscillator
	12M X'tal	High speed crystal /resonator (e.g. 12M) for external high clock oscillator
	4M X'tal	Standard crystal /resonator (e.g. 3.58M) for external high clock oscillator
High_Clk / 2	Enable	External high clock divided by two, Fosc = high clock / 2
	Disable	Fosc = high clock
OSG	Enable	Enable Oscillator Safe Guard function
	Disable	Disable Oscillator Safe Guard function
Watch_Dog	Enable	Enable Watch Dog function
	Disable	Disable Watch Dog function
Pull_Up	Enable	Enable all on-chip pull-up resisters
	Disable	Disable all on-chip pull-up resisters
INT_16K_RC	Always_ON	Force Watch Dog Timer clock source come from INT 16K RC. Also INT 16 RC never stop both in power down and green mode that means Watch Dog Timer will always enable both in power down and green mode.
	By_CPUM	Enable or Disable internal 16K(at 3V) RC clock by CPUM register
RST_P03	P03	Set P0.3 as input only I/O with wakeup function
	RST	Set P0.3 as Reset pin

PROGRAM CHECK LIST

Item	Description
Undefined Bits	All bits those are marked as "0" (undefined bits) in system registers should be set "0" to avoid unpredicted system errors.
PWM1	Set PWM1 (P5.3) pin as output mode.
Interrupt	Do not enable interrupt before initializing RAM.
Non-Used I/O	Non-used I/O ports should be set as output low mode or pull-up at input mode to save current consumption.
Sleep Mode	Enable on-chip pull-up resisters of port 0 and port 1 to avoid unpredicted wakeup.
Stack Buffer	Be careful of function call and interrupt service routine operation. Don't let stack buffer overflow or underflow.
System Initial	1. Write 0x7F into STKP register to initial stack pointer and disable global interrupt 2. Clear all RAM. 3. Initialize all system register even unused registers.
Noisy Immunity	1. Enable OSG and High_Clk / 2 code option together 2. Enable the watchdog option to protect system crash. 3. Non-used I/O ports should be set as output low mode 4. Constantly refresh important system registers and variables in RAM to avoid system crash by a high electrical fast transient noise.

14 ELECTRICAL CHARACTERISTIC

ABSOLUTE MAXIMUM RATING

(All of the voltages referenced to Vss)

Supply voltage (Vdd)………………………………………………………………………………… - 0.3V ~ 6.0V
Input in voltage (Vin)………………………………………………………………………..Vss - 0.2V ~ Vdd + 0.2V
Operating ambient temperature (Topr)………………………………………………………………0°C ~ + 70°C
Storage ambient temperature (Tstor)………………………………………………………-30°C ~ + 125°C
Power consumption (Pc)…………………………………………………………………………500 mW

STANDARD ELECTRICAL CHARACTERISTIC

(All of voltages referenced to Vss, Vdd = 5.0V, fosc = 3.579545 MHz, ambient temperature is 25°C unless otherwise notice.)

PARAMETER	SYM.	DESCRIPTION		MIN.	TYP.	MAX.	UNIT
Operating voltage	Vdd	Normal mode, Vpp = Vdd		2.2	5.0	5.5	V
		Programming mode, Vpp = 12.5V		4.5	5.0	5.5	
RAM Data Retention voltage	Vdr			-	1.5	-	V
Input Low Voltage	ViL1	All input pins except those specified below		Vss	-	0.3Vdd	V
	ViL2	Input with Schmitt trigger buffer - Port0		Vss	-	0.2Vdd	V
	ViL3	Reset pin ; Xin (in RC mode)		Vss	-	0.3Vdd	V
	ViL4	Xin (in X'tal mode)		Vss	-	0.3Vdd	V
Input High Voltage	ViH1	All input pins except those specified below		0.7Vdd	-	Vdd	V
	ViH2	Input with Schmitt trigger buffer –Port0		0.8Vdd	-	Vdd	V
	ViH3	Reset pin ; Xin (in RC mode)		0.9Vdd	-	Vdd	V
	ViH4	Xin (in X'tal mode)		0.7Vdd	-	Vdd	V
Reset pin leakage current	Ilekg	Vin = Vdd		-	-	1	uA
I/O port input leakage current	Ilekg	Pull-up resistor disable, Vin = Vdd		-	-	2	uA
Port1 output source current sink current	IoH	Vop = Vdd – 0.5V		-	15	-	mA
	IoL	Vop = Vss + 0.5V		-	15	-	
Port2 output source current sink current	IoH	Vop = Vdd – 0.5V		-	15	-	mA
	IoL	Vop = Vss + 0.5V		-	15	-	
INTn trigger pulse width	Tint0	INT0 ~ INT2 interrupt request pulse width		2/fcpu	-	-	cycle
Oscillator Frrquency	Fosc	Crystal type or ceramic resonator		32968	4M	20M	Hz
		VDD = 3V, RC type for external mode		-	8M	-	
		VDD = 5V, RC type for external mode		-	15M	-	
Supply Current	Idd1	Run Mode	Vdd= 5V 4Mhz	-	5	8.5	mA
			Vdd= 3V 4Mhz	-	1.5	3	mA
			Vdd= 3V 32768Hz	-	45	90	uA
	Idd2	Internal RC mode (16KHz, 3V)	Vdd= 5V	-	18	40	uA
			Vdd= 3V	-	15	30	uA
	Idd3	Stop mode	Vdd= 5V	-	9	18	uA
			Vdd= 3V	-	2.5	6	uA
LVD Detect Voltage	Vdet	Low voltage detect level		-	1.8	-	V
LVD current	Ilvd	LVD enable operating current		-	2	-	uA

SONiX MASK APPROVAL SHEET
SN8A160X

1. Company (Customer) : _____   Date : _____ - _____ - _____

2. MCU Part Number : _____   Code number : _____ - _____

3. Filename : _____.SN8   Checksum : _____ (EPROM)

4. Approved by :   ☐ OTP   ☐ ICE   ICE Version (e.g. S8KD-2): _____

5. Supply Voltage : _____Volt   High clock = _____Hz

6. Code Option (SN8A160X)

High_Clk	☐ 4M_X'tal		☐ RC		
	☐ 12M_X'tal (High speed crystal > 12M)		☐ 32K_X'tal		
Watch_Dog	☐ Enable	☐ Disable	High_Clk / 2	☐ Enable	☐ Disable
OSG	☐ Enable	☐ Disable	LVD	☐ Enable	☐ Disable
Pull_Up **(SN8A1604A Only)**	☐ Enable	☐ Disable	INT_16K_RC **(SN8A1604A Only)**	☐Always_on	☐ By_CPUM

7. Package mark (for package type only)
